(PIs: Mason, Schürer, Solo-Gabriele)

Motivation & Objectives

Infected humans excrete COVID-19 virus in feces and urine

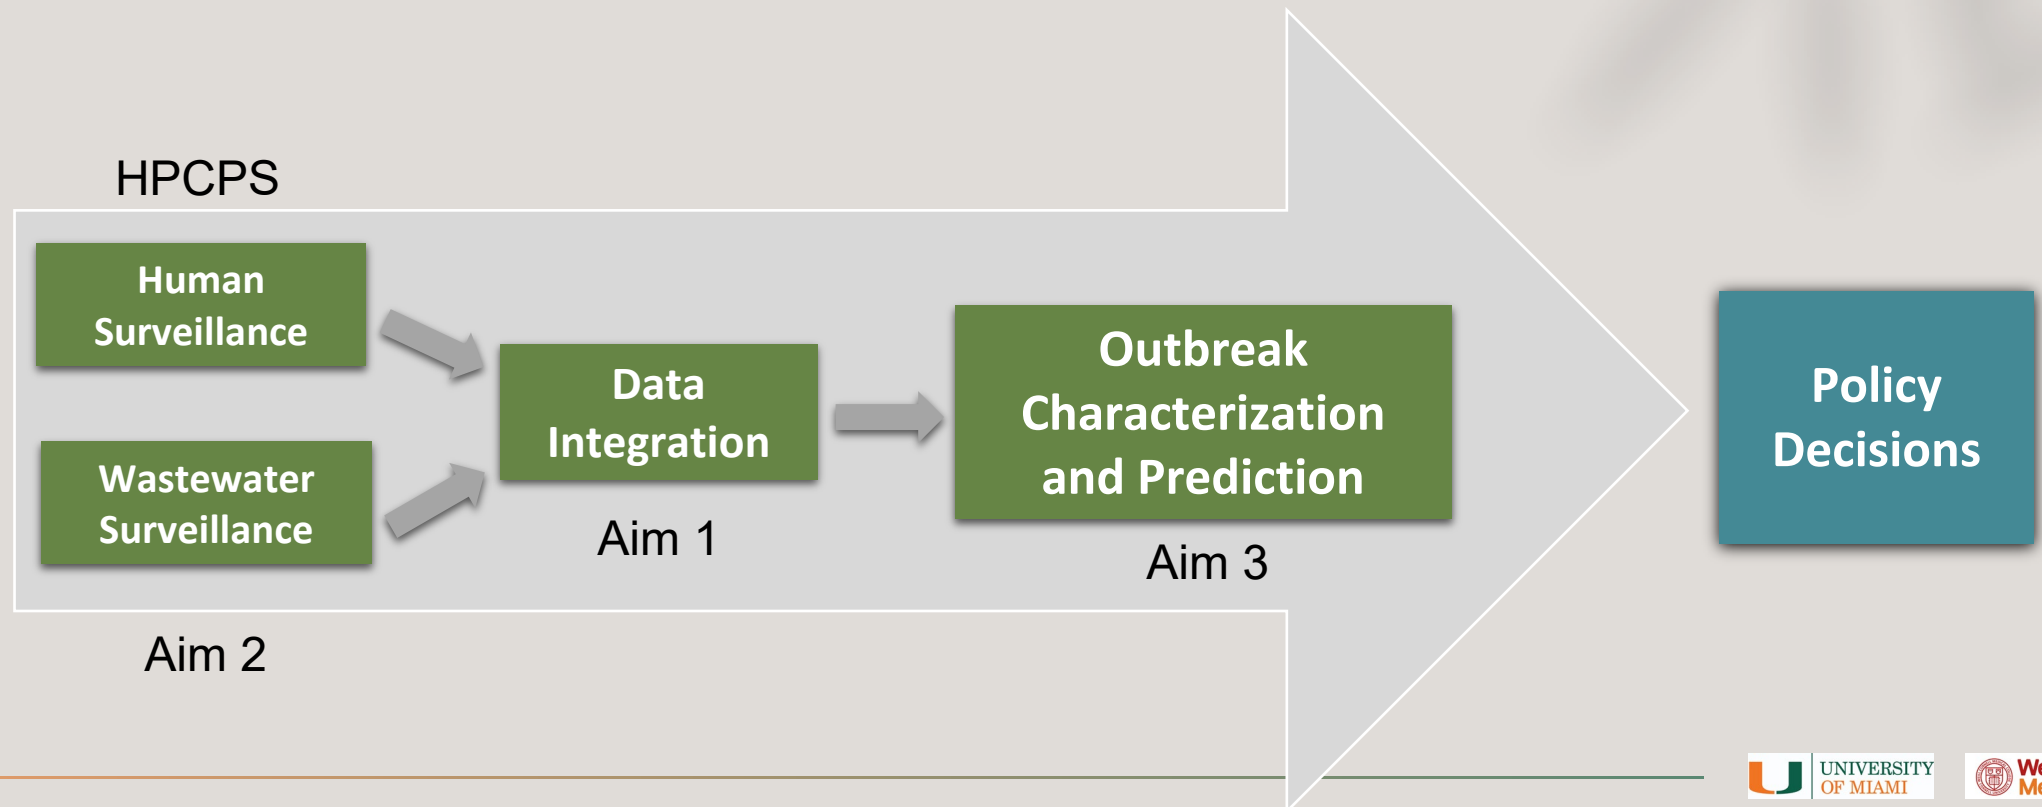

Ultimate objective: Relate wastewater measurements to predict COVID-19 cases.

SF-RAD: SARS-CoV-2 Wastewater-Based Surveillance

Aims of the Study

1. Data standardization and informatics infrastructure
2. Wastewater characterization
3. Integration with human health surveillance

Human Surveillance

Student Residents

Fall'20/Spring'21

- Students tested weekly
- Nasal swab, qPCR & breath test
- COVID results and total tests by building/dorm room

Summer/Fall'21

- Unvaccinated students tested weekly
- All students tested when wastewater exceeds

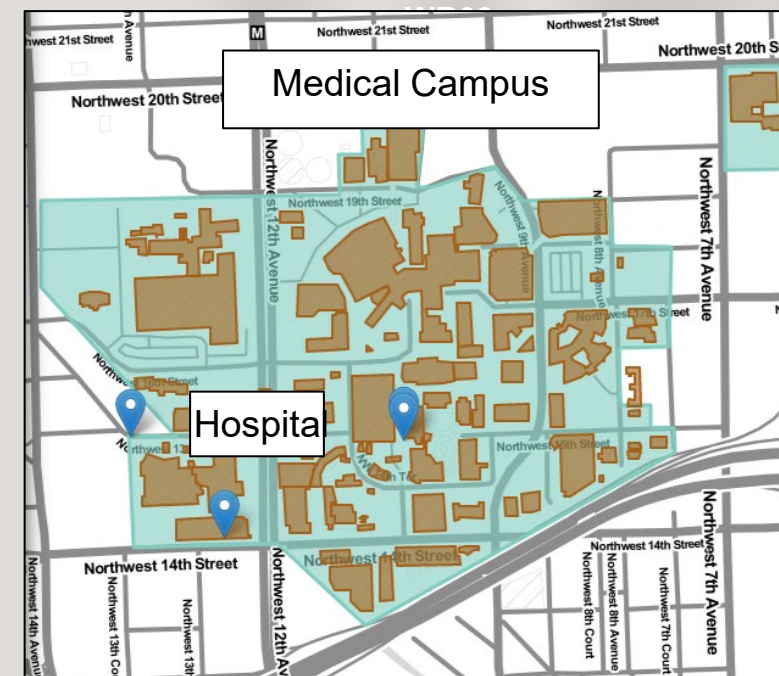

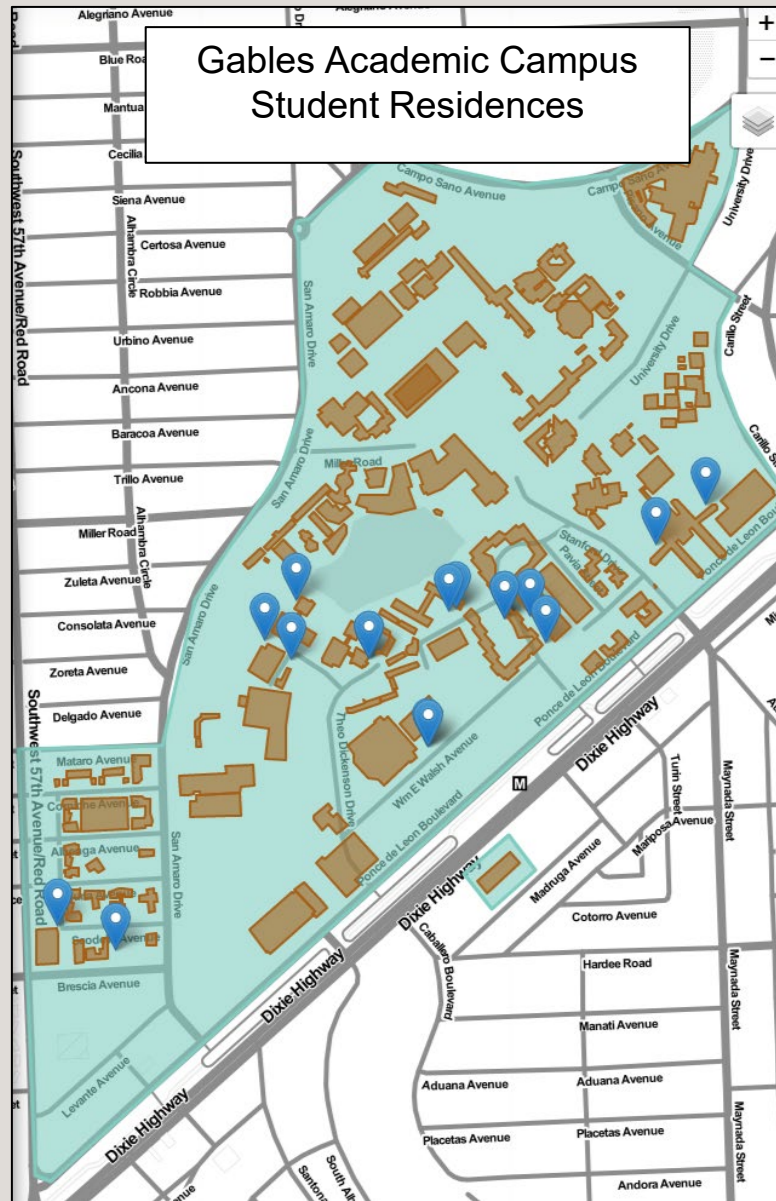

University Hospital

- Treat known COVID patients
- Electronic medical records pulled regularly

Miami-Dade County Residents (FDOH)

- Positives by zip code
- Number of tests by zip code

Sample Collection Plans

Sample Frequency: weekly, 2x per week, daily, hourly

Wastewater-Based Surveillance Experimental Overview

- Wastewater Sampling (How/Where?)
- Watershed Scales (Building, Cluster, Community)
- Overall Wastewater Processing Workflow
- Molecular Detection of SARS-CoV-2
- Weekly Samples: Evaluate predictive ability of wastewater
 - Can normalization of results improve predictive ability?
- Daily Samples: Evaluate the most effective time frequency of sample collection
- Hourly Samples: Evaluate SARS-CoV-2 degradation relative to hour-to-hour variability. Are composite samples better than grab samples?

Wastewater Sampling

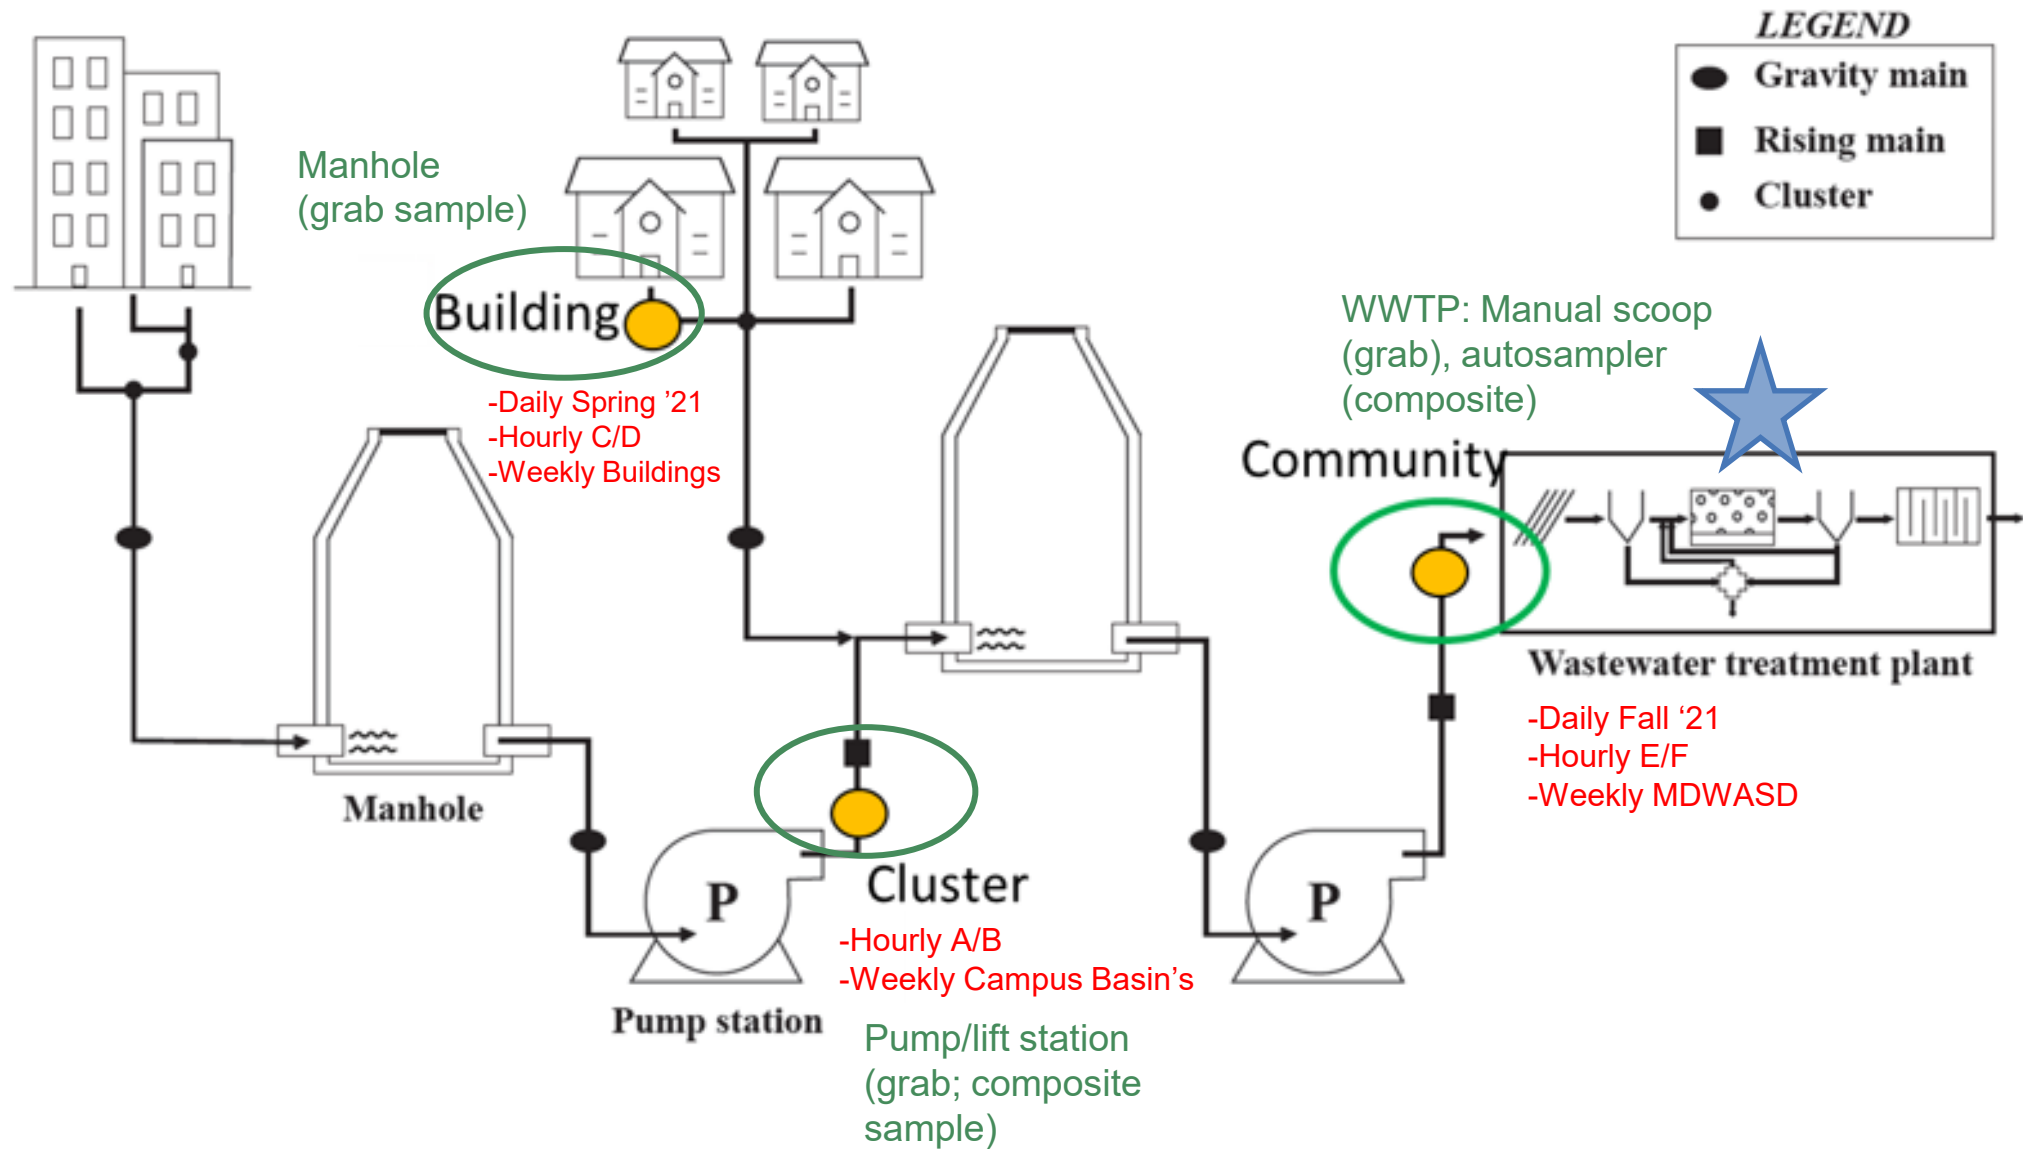

Where do we sample wastewater from?

- Manholes (building scale)
- Pump/Lift Stations (cluster scale)
- Wastewater Treatment Plant (community scale)

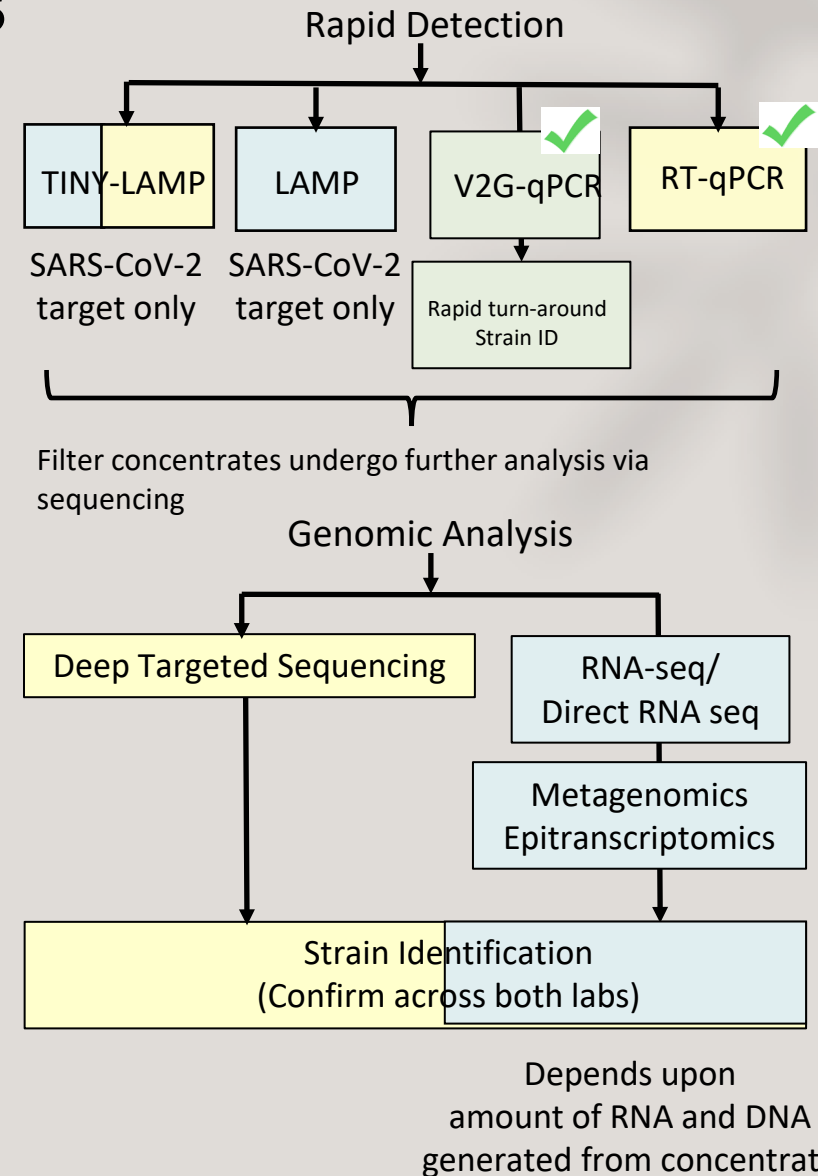

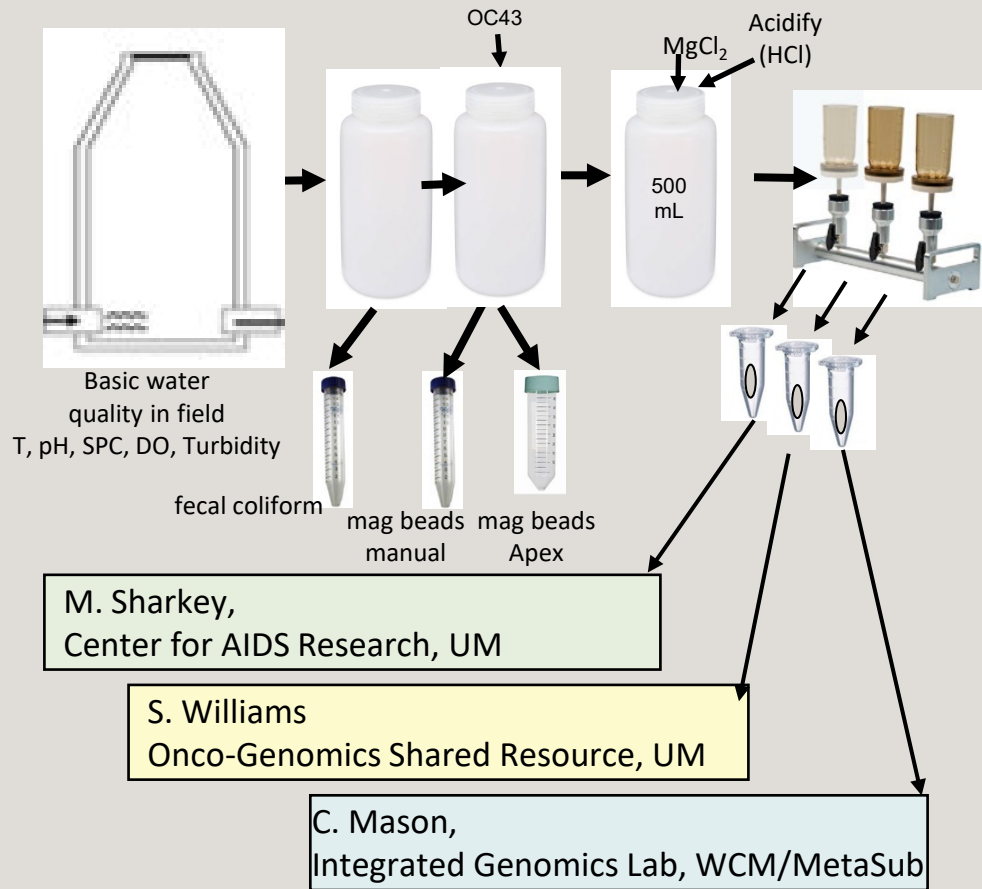

How do we collect the wastewater?

- Chain and bottle (grab)
- Manual or battery powered pump (grab)
- Automatic sampler (composite)
- Wastewater treatment plant (composite; grab)

Watershed Scales Visualized

University of Miami & Weill Cornell Medicine Collaborative Sample Analysis

Overall Wastewater Sample Processing

Molecular Analysis of Processed Wastewater Samples

SARS-CoV-2 Detection
via V2G-qPCR

Nucleic Acid Extraction & Purification from EN Filters

RNA Extraction/Purification

- Zymo Research QuickRNA Viral Kit
- Silica spin column vs. chemical-based
- Wastewater EN filter lysate samples

Main Steps of RNA Extraction (for qPCR quantification):

- Isolation
- Purification
- Concentration

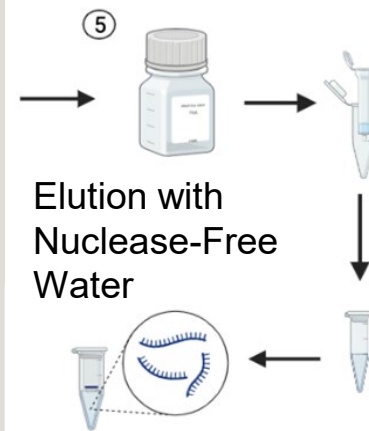

Zymo Binding Buffer Added to W.W. Lysate

Wash Steps utilizing Zymo Wash Buffer

Final wash step with 100% Ethanol

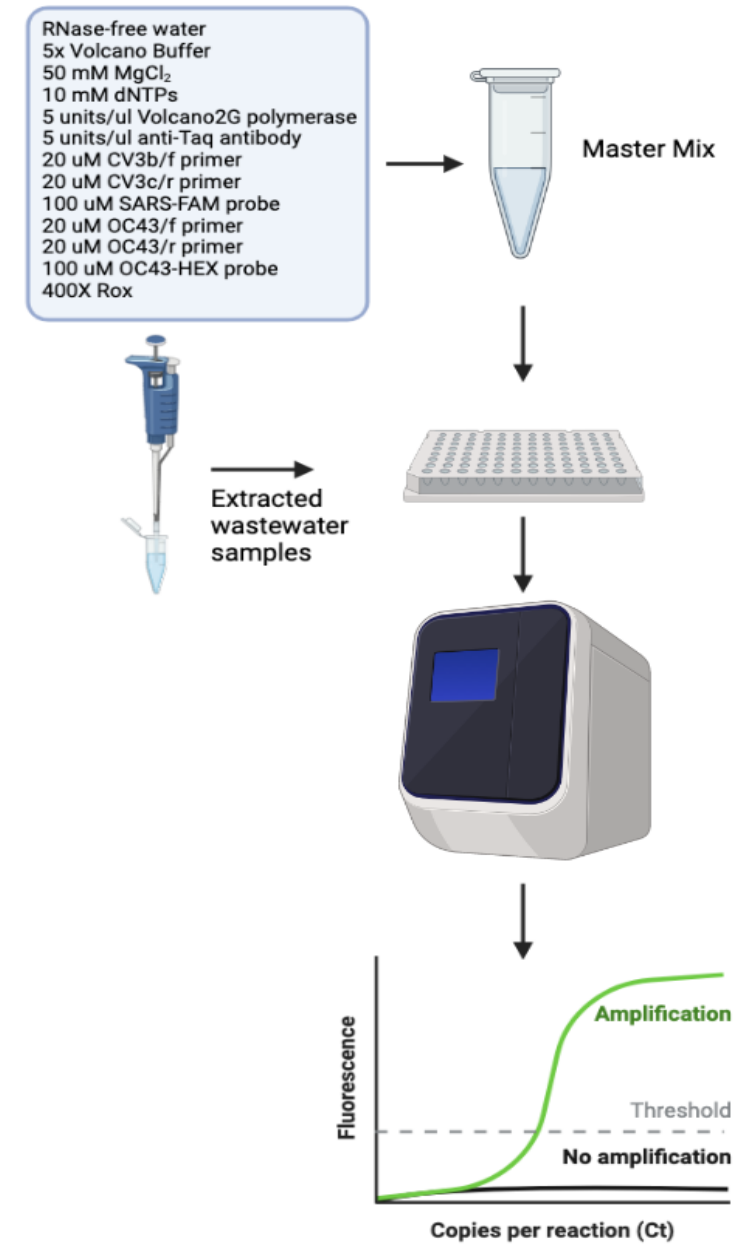

Elution with
Nuclease-Free
Water

V2G-qPCR Reaction Setup

1. Pull out appropriate reagents and thaw/place on ice
2. Create master mix by combining appropriate reagents for specified V2G-qPCR target (SARS-CoV-2, B2M, OC43, HIV, PMMoV, SIV)
3. Load the 96-well plate with master mix (keep plate on ice-block)
4. Load extracted/purified RNA from wastewater concentrate sample, standards ($10^1 - 10^5$), and nuclease-free water per well for NTC's
5. Seal and centrifuge plate briefly to lift bubbles from bottom of wells

V2G-qPCR Plating Visualized

Load the plate with master mix first

Then add RNA, Standards, and NTC's

Apply adhesive seal

Weekly, Hourly, & Daily Sampling Results

University Scale Sampling alongside Human Health

Building, Cluster, & Community Scale

University Surveillance

University Surveillance

University Surveillance

Naresh Kumar & Alejandro Mantero

- SARS-CoV-2 in wastewater was a 4-day lead indicator
- Positivity (%) = $9 \ln(C) / 10$
 - 10^2 gc/L of SARS-CoV-2 in wastewater associated with 4% positivity.
 - 10^4 gc/L \rightarrow 8%
 - 10^6 gc/L \rightarrow 12%

Vaccine Opt In
For Students

Normalization – Why It's Important

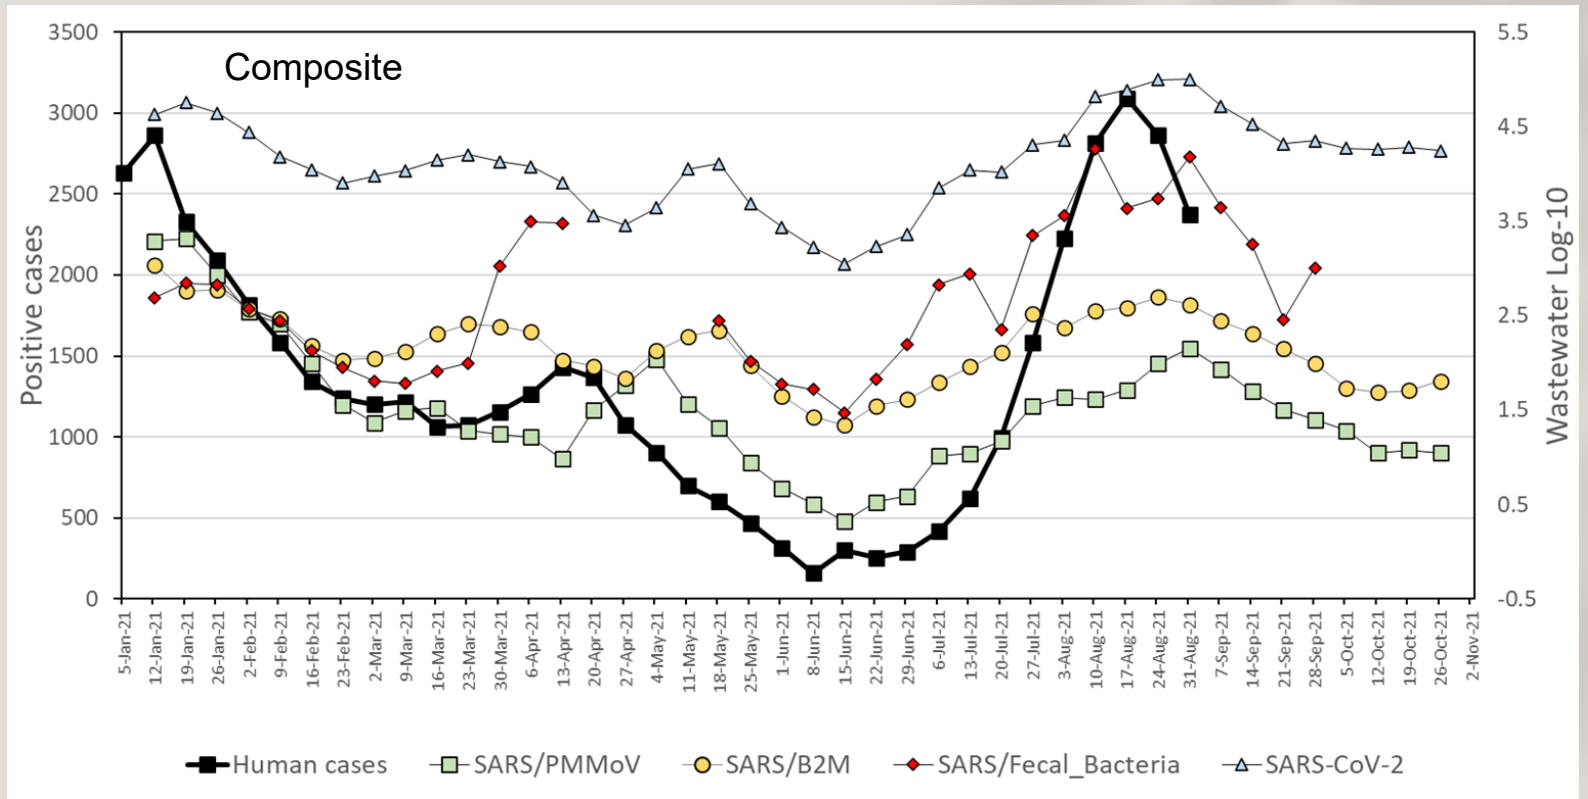

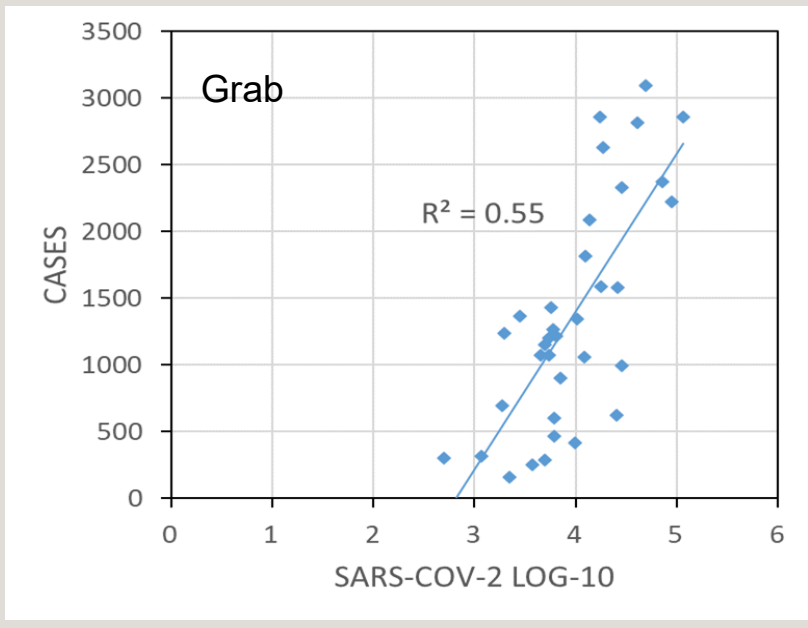

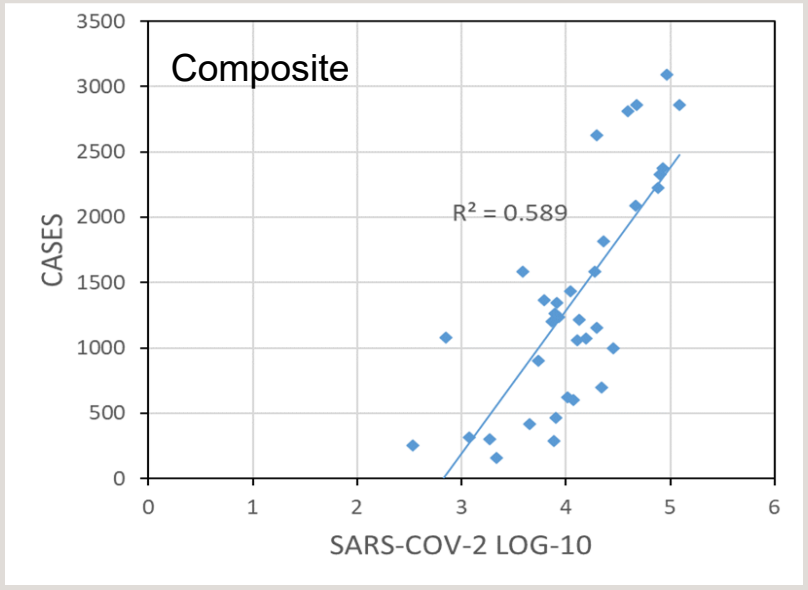

- Wastewater: black water and grey water
- Will normalization by a fecal indicator help improve the COVID-19 predictive capability of wastewater water?
 - PMMoV (Pepper Mild Mottled Virus) by V2G-qPCR
 - B2M (Beta-2-Microglobulin, protein coding gene) by V2G-qPCR
 - Fecal coliform bacteria by culture
- Evaluate at campus and community scale
- At community scale evaluate grab versus composites

Comparison of Normalized B2M, PMMoV, Fecal Bacteria, Raw Wastewater and Human Cases

University Scale – Weekly Sampling

Weekly Sampling Results: Community Scale (Central District WWTP)

	Composite R ²	Grab R ²
SARS-CoV-2	0.59	0.55
SARS/PMMoV	0.45	0.35
SARS/B2M	0.56	0.40
SARS/Fecal coliform	0.25	0.16

Normalization – What we've Found

- At community scale, normalization with fecal indicators does not provide improvement for COVID-19 predictions
- Composite samples overall better than grab samples for COVID-19 predictions
- At campus scale, normalization (with PMMoV and B2M) appears to provide some improvement

Daily Sampling – UM Campus

Fig. 10. SARS-CoV-2 distribution and COVID-19 cases in a UM dorm March-May 2021 (vertical red line indicates diagnosis of a COVID-19 case).

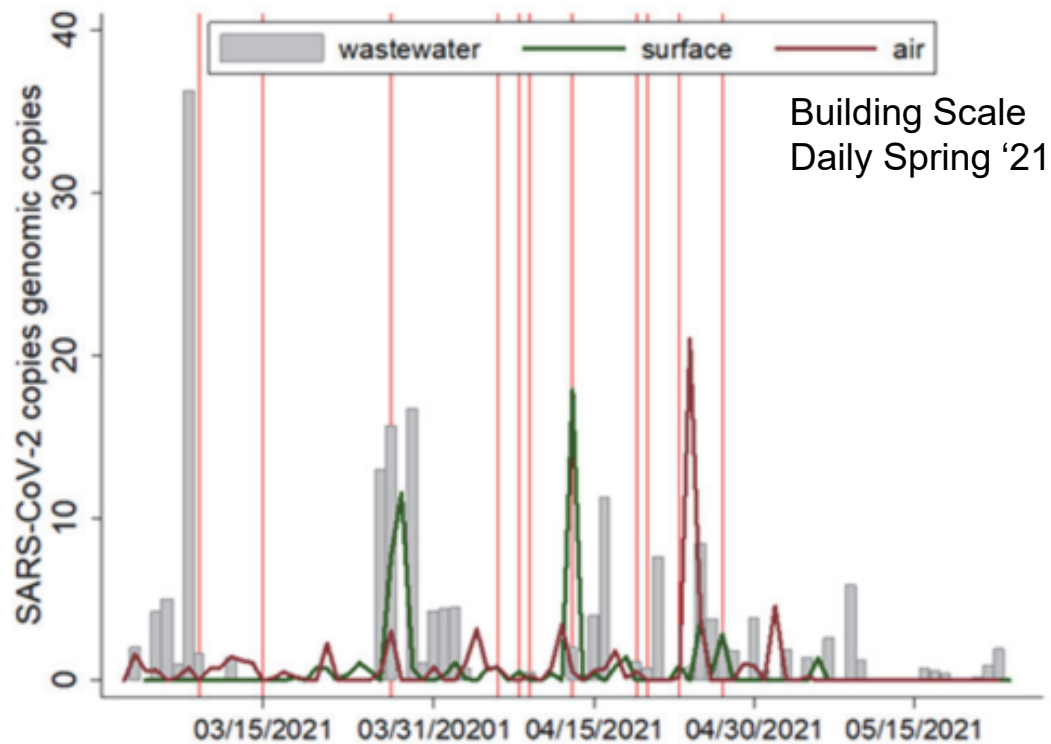

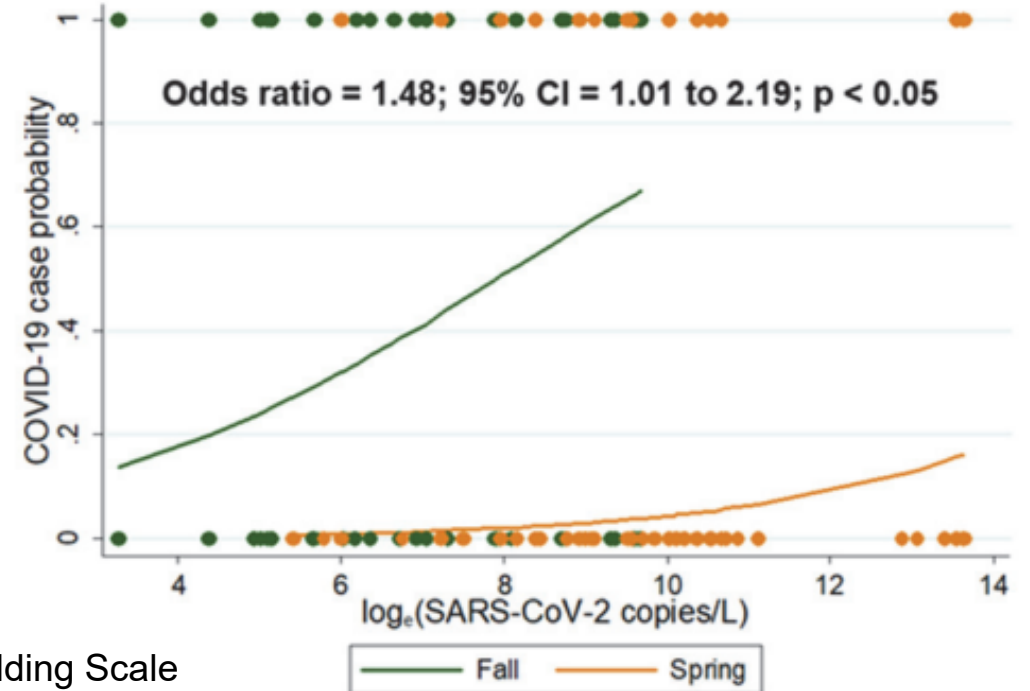

Fig .11. Probability of a COVID-19 case at the UM campus with respect to four day lagged wastewater SARS-CoV-2 concentration, 2020 to 2021.

SARS-CoV-2 Presence: Daily/Weekly/Hourly

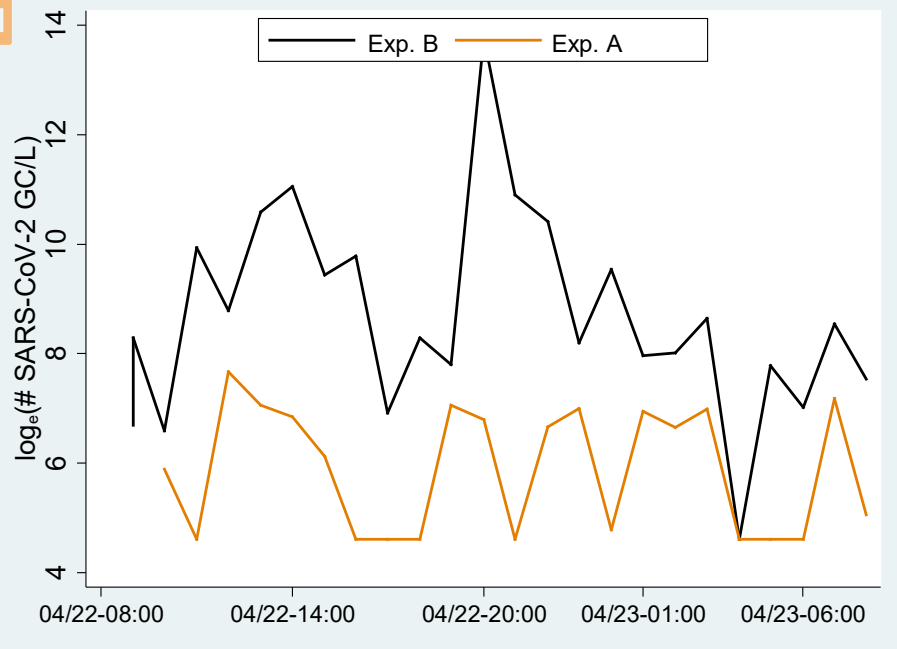

- Graph showing SARS-CoV-2 concentration wastewater at different sites and new COVID-19 cases in Miami-Dade county

- Comparison of SARS-CoV-2 concentration in hourly, daily and weekly samples

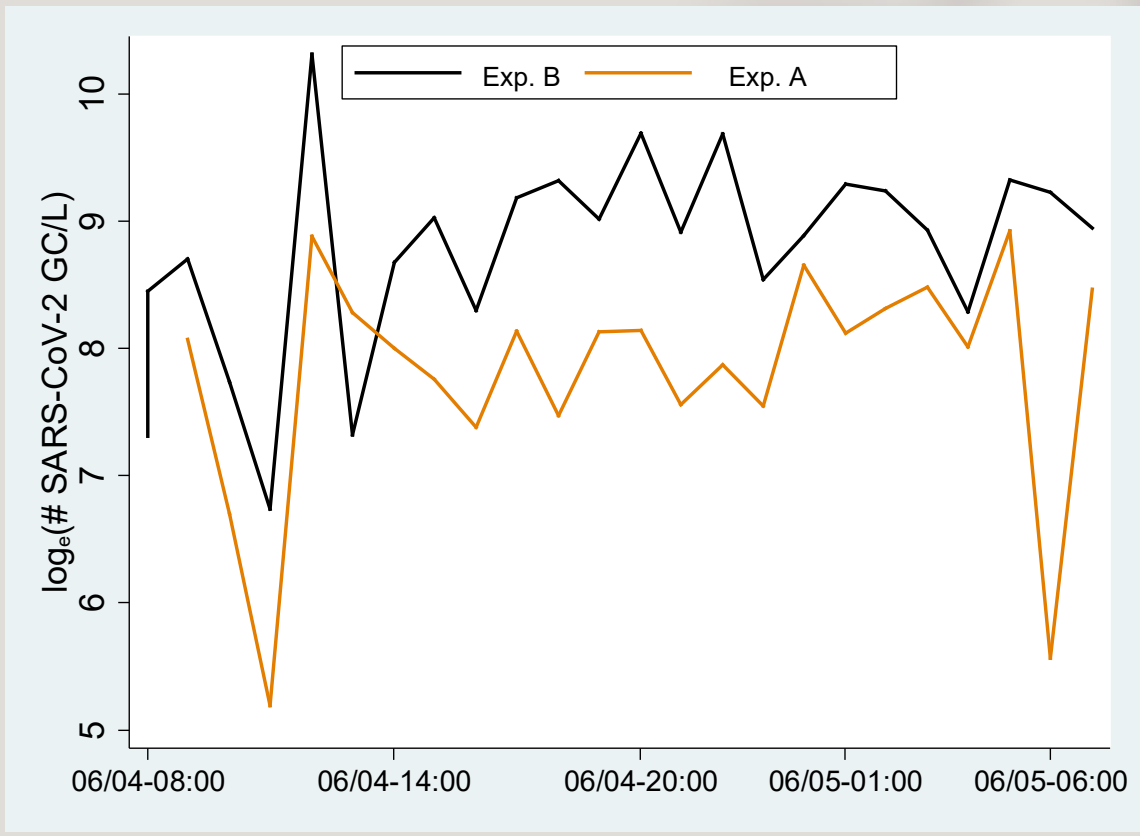

Hourly Sampling Time Lagged SARS-CoV-2 Abundance

Hourly Experiment #2 (Building) performed April 22-23, 2021: UM

Hourly Experiment #1 (Cluster) performed April 8-9, 2021: UM

Hourly Experiment #3 (Community) performed June 4-5, 2021: CDWWTP

Experiment A: assessing viral degradation over hourly lag-time
Experiment B: exploring hour-to-hour variability of viral abundance

Building Scale: Hourly Degradation of Viral Presence

• SARS-CoV-2 • SIV

Statistical Overview (95% Confidence)	SARS-CoV-2		SIV	
	R ²	p-value	R ²	p-value
Building – Exp. 1A	0.027192	0.441291	0.149265	0.062205

Cluster Scale: Hourly Degradation of Viral Presence

Comparison of Average Hourly Viral Concentration: SARS-CoV-2 & Spike-In Control SIV
(Cluster Scale - 2A)

- SARS-CoV-2
- SIV

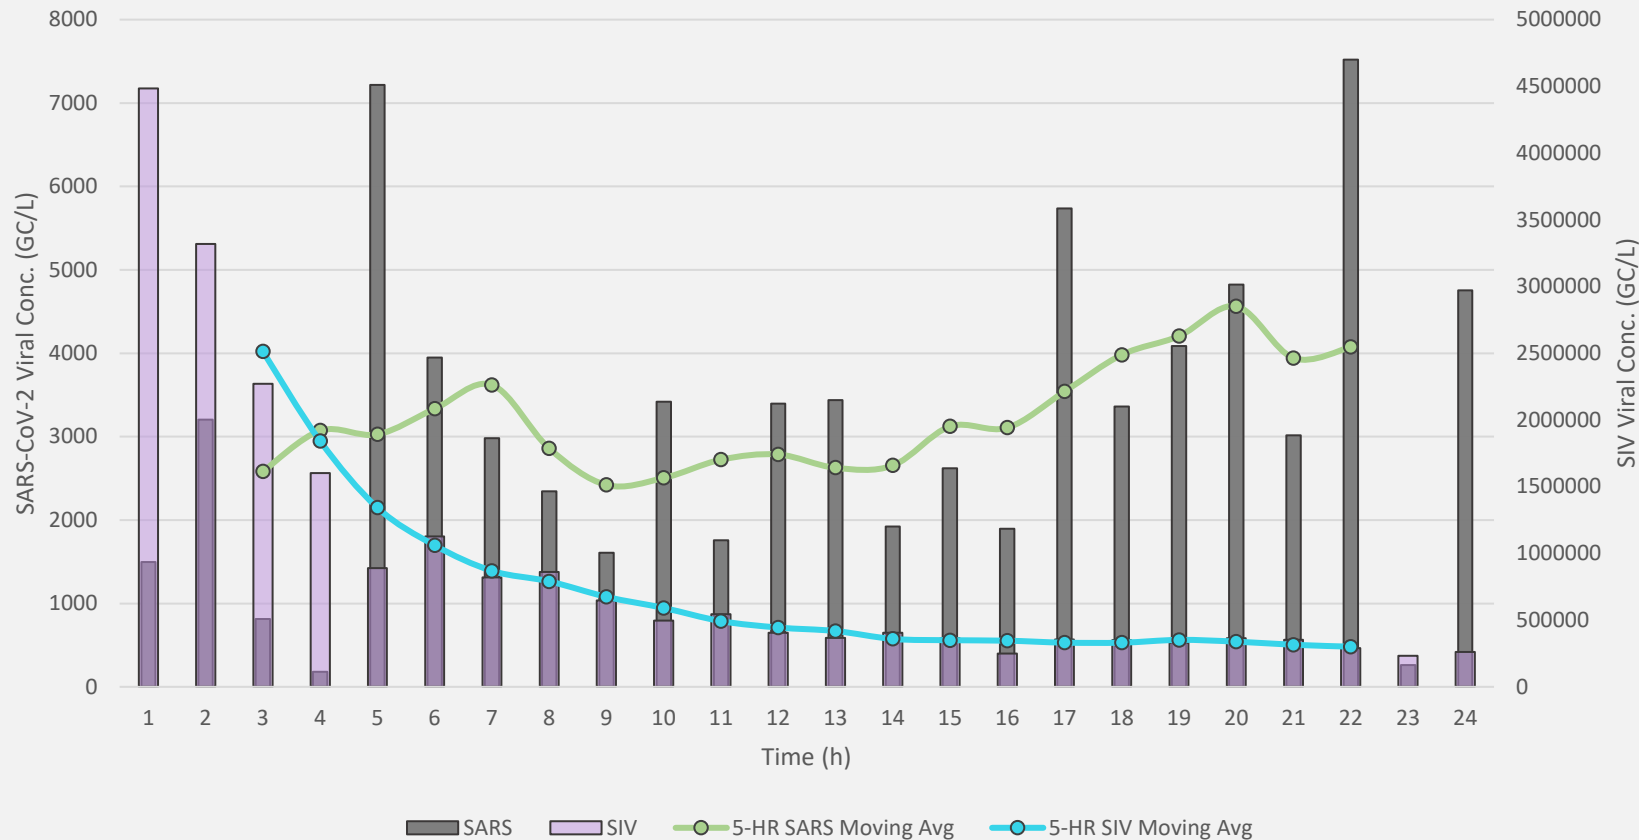

Degradation of SARS-CoV-2 and SIV over 24-hours: Cluster Scale 2A

Statistical Overview (95% Confidence)	SARS-CoV-2		SIV	
	R ²	p-value	R ²	p-value
Cluster – Exp. 2A	0.091584	0.150609	0.472842	0.000205

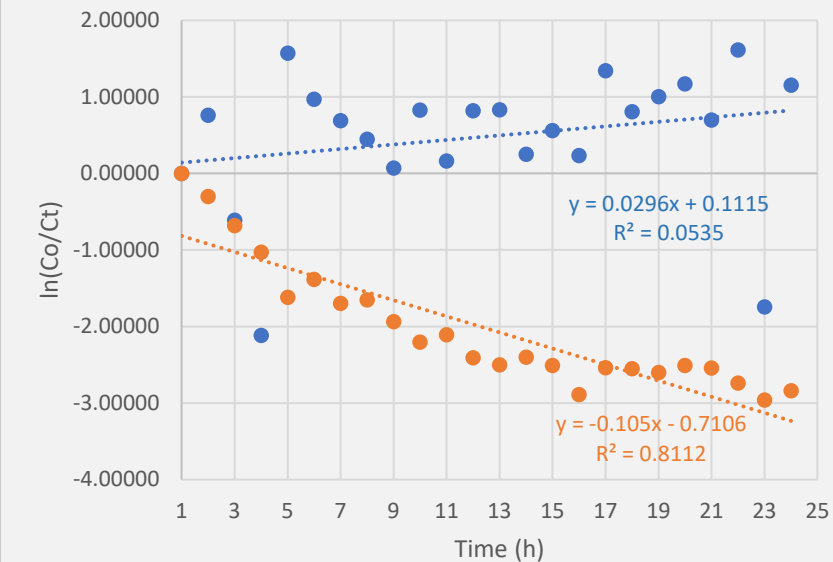

Community Scale: Hourly Degradation of Viral Presence

Comparison of Average Hourly Viral Concentration: SARS-CoV-2 & Spike-In Control SIV
(Community Scale - 3A)

• SARS-CoV-2 • SIV

Degradation of SARS-CoV-2 and SIV over 24-hours: Expt 3A (Community)

Statistical Overview (95% Confidence)	SARS-CoV-2		SIV	
	R ²	p-value	R ²	p-value
Experiment Scale				
Community – Exp. 3A	0.053458	0.277017	0.811224	2.01E-09

Hour-to-Hour Variability and Normalization Factors: Building and Cluster Scale

Hour-to-Hour Variability and Normalization Factors: Community Scale

Conclusions found from Hourly Sampling Experiments

- Wastewater in sewer variable over time
 - 3 log-10 variation in SARS-CoV-2 observed at building scale
 - 1.5 log-10 variation in SARS-CoV-2 observed at cluster and community scale
- Degradation at room temperature over time, secondary for SARS-CoV-2
 - Degradation of SIV statistically correlated with time
- B2M & PMMoV better normalizers of SARS-CoV-2 viral trends than Fecal coliform by culture
- Specific conductivity correlated with fecal coliform at building scale (only physical water parameter of significance)
 - Fecal coliform shows evidence of multiplication in sewer
