

# Wastewater-based monitoring of COVID-19

Presented by:  
Helena Solo-Gabriele, PhD  
University of Miami

**Weill Cornell  
Medicine**

Funded by  
NIH RADx-rad Grant  
1U01DA053941-01

**SF-RAD**  
<https://covidfrac.org/>

# Motivation & Objectives

Infected humans excrete COVID-19 virus in feces and urine

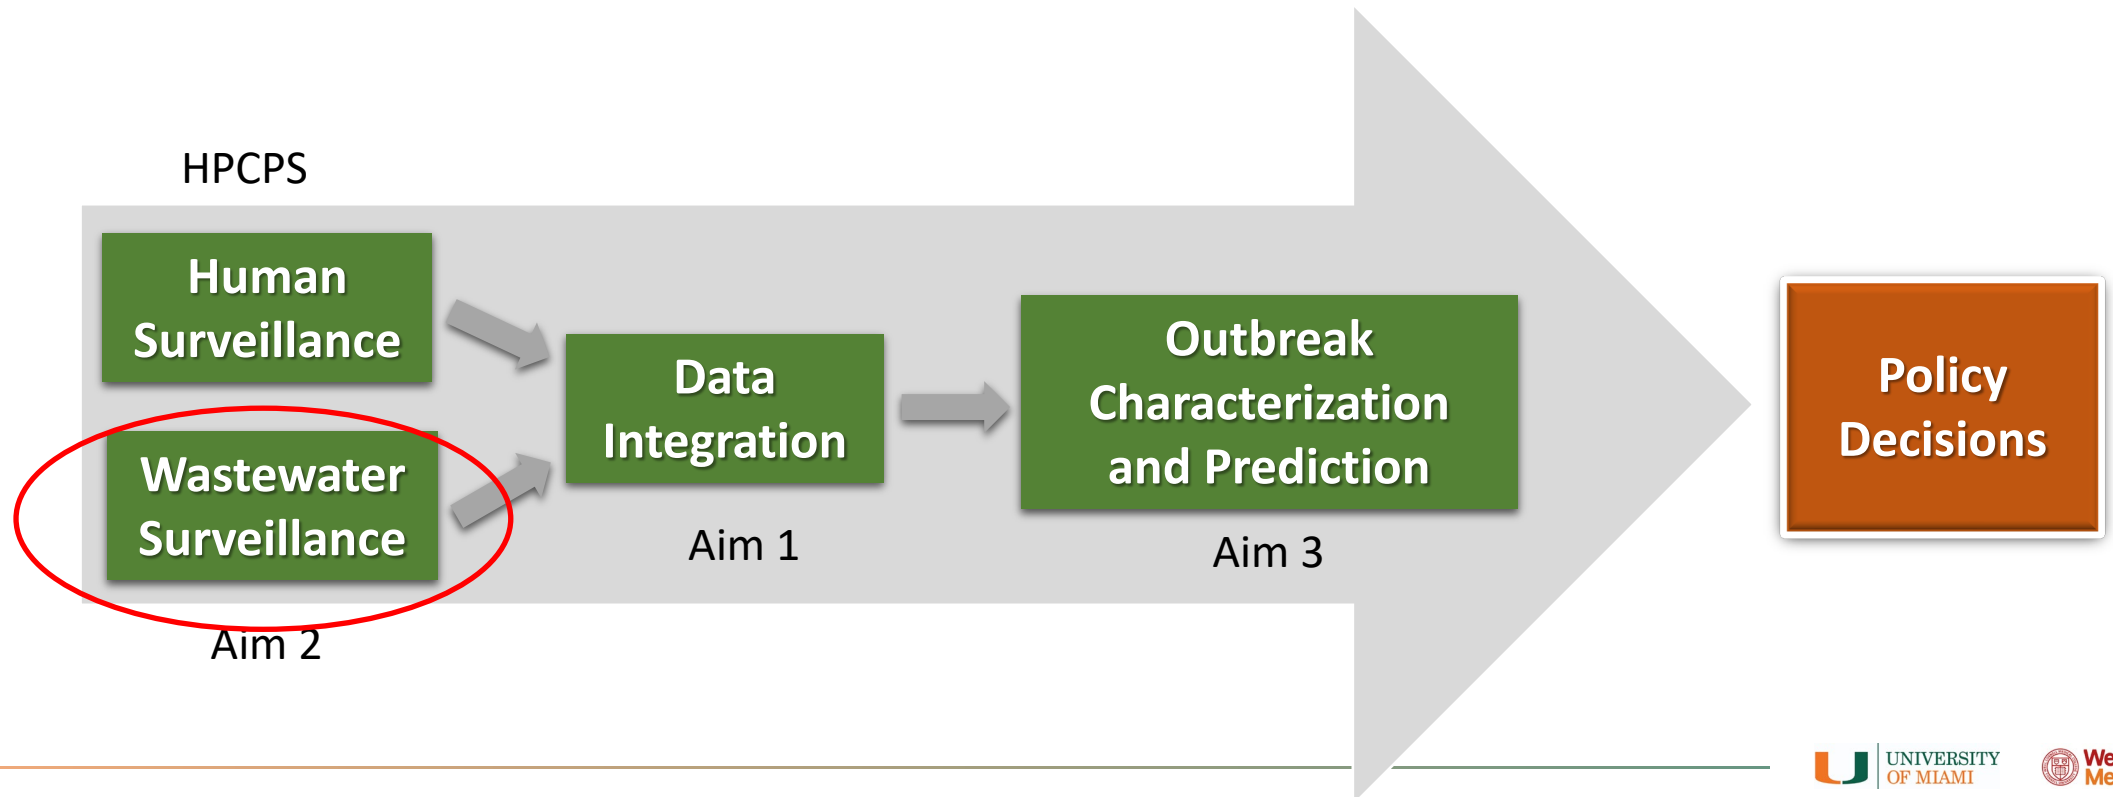

Ultimate objective: Relate wastewater measurements to predict COVID-19 cases.

# SF-RAD: SARS-CoV-2 Wastewater-Based Surveillance

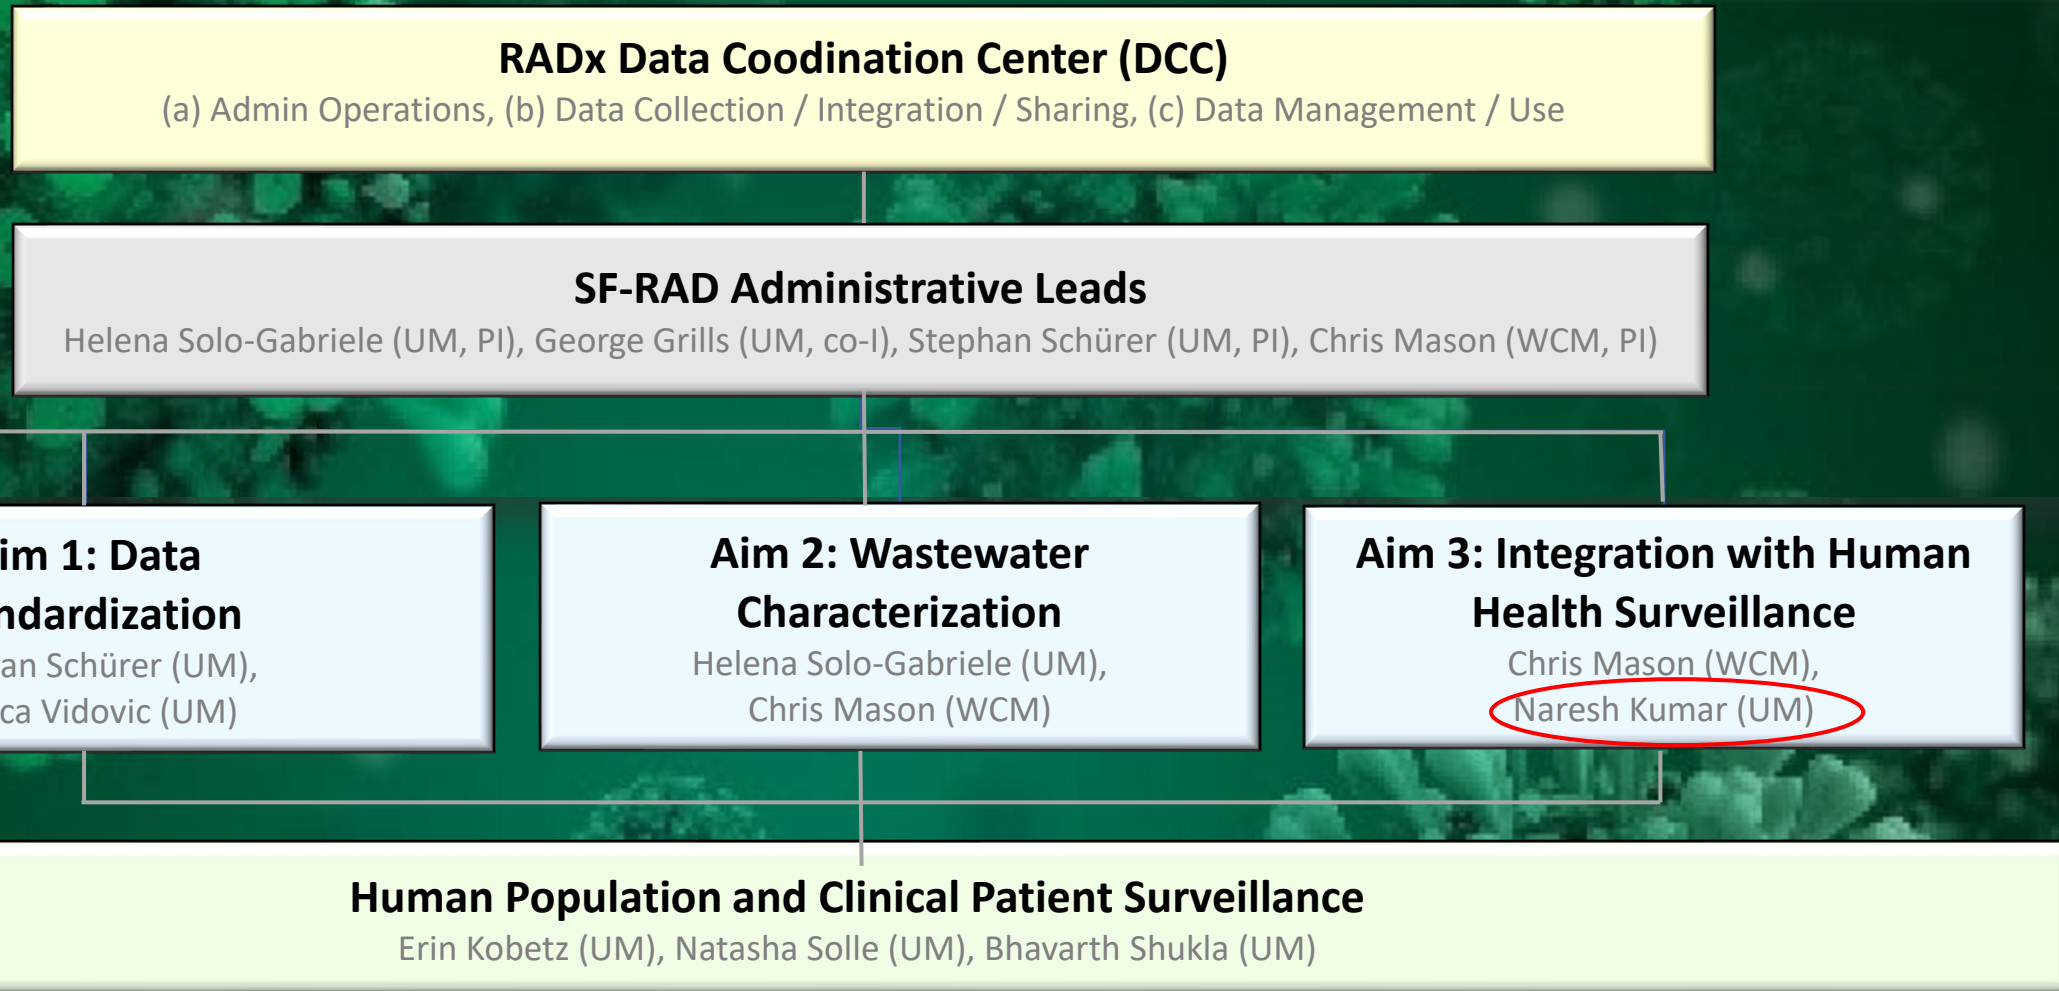

## Aims

1. Data standardization and informatics infrastructure
2. Wastewater characterization
3. Integration with human health surveillance

# SF-RAD: SARS-CoV-2 Wastewater-Based Surveillance

## Administrative Organization and Leadership

# Aim 2: Wastewater Characterization

# Human Surveillance

## Student Residents

### Fall'20/Spring'21

- Students tested weekly (nasal swab, qPCR) Supplemented by breath test
- COVID results and total tests by building/dorm room

### Summer/Fall'21

- Unvaccinated students tested weekly
- All students tested when wastewater exceeds

## University Hospital

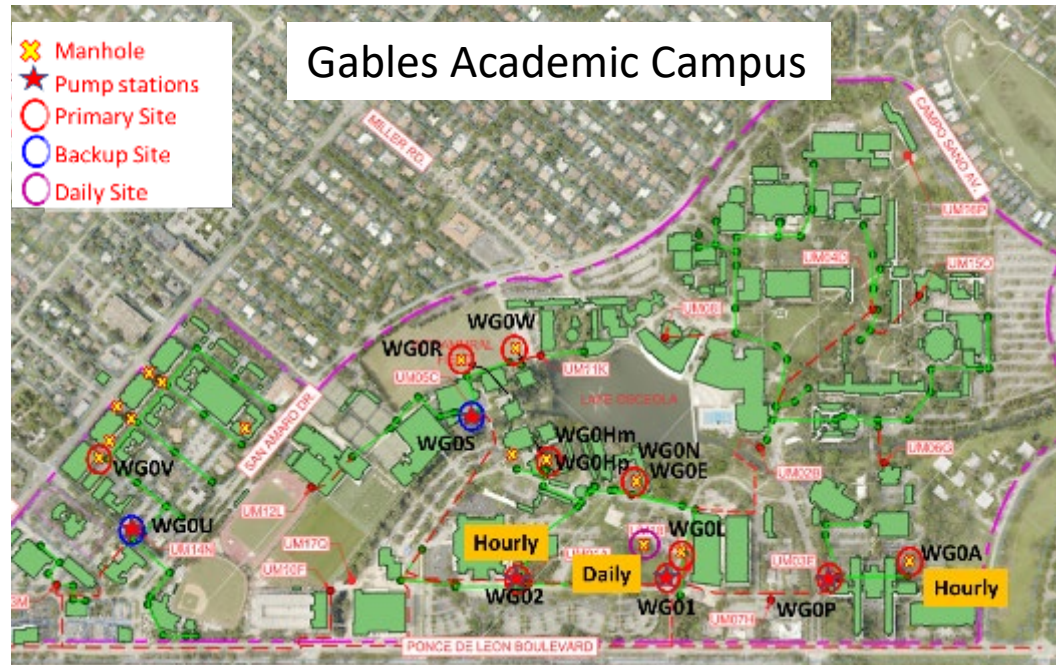

- Treat known COVID patients
- Electronic medical records pulled regularly

## Miami-Dade County Residents (FDOH)

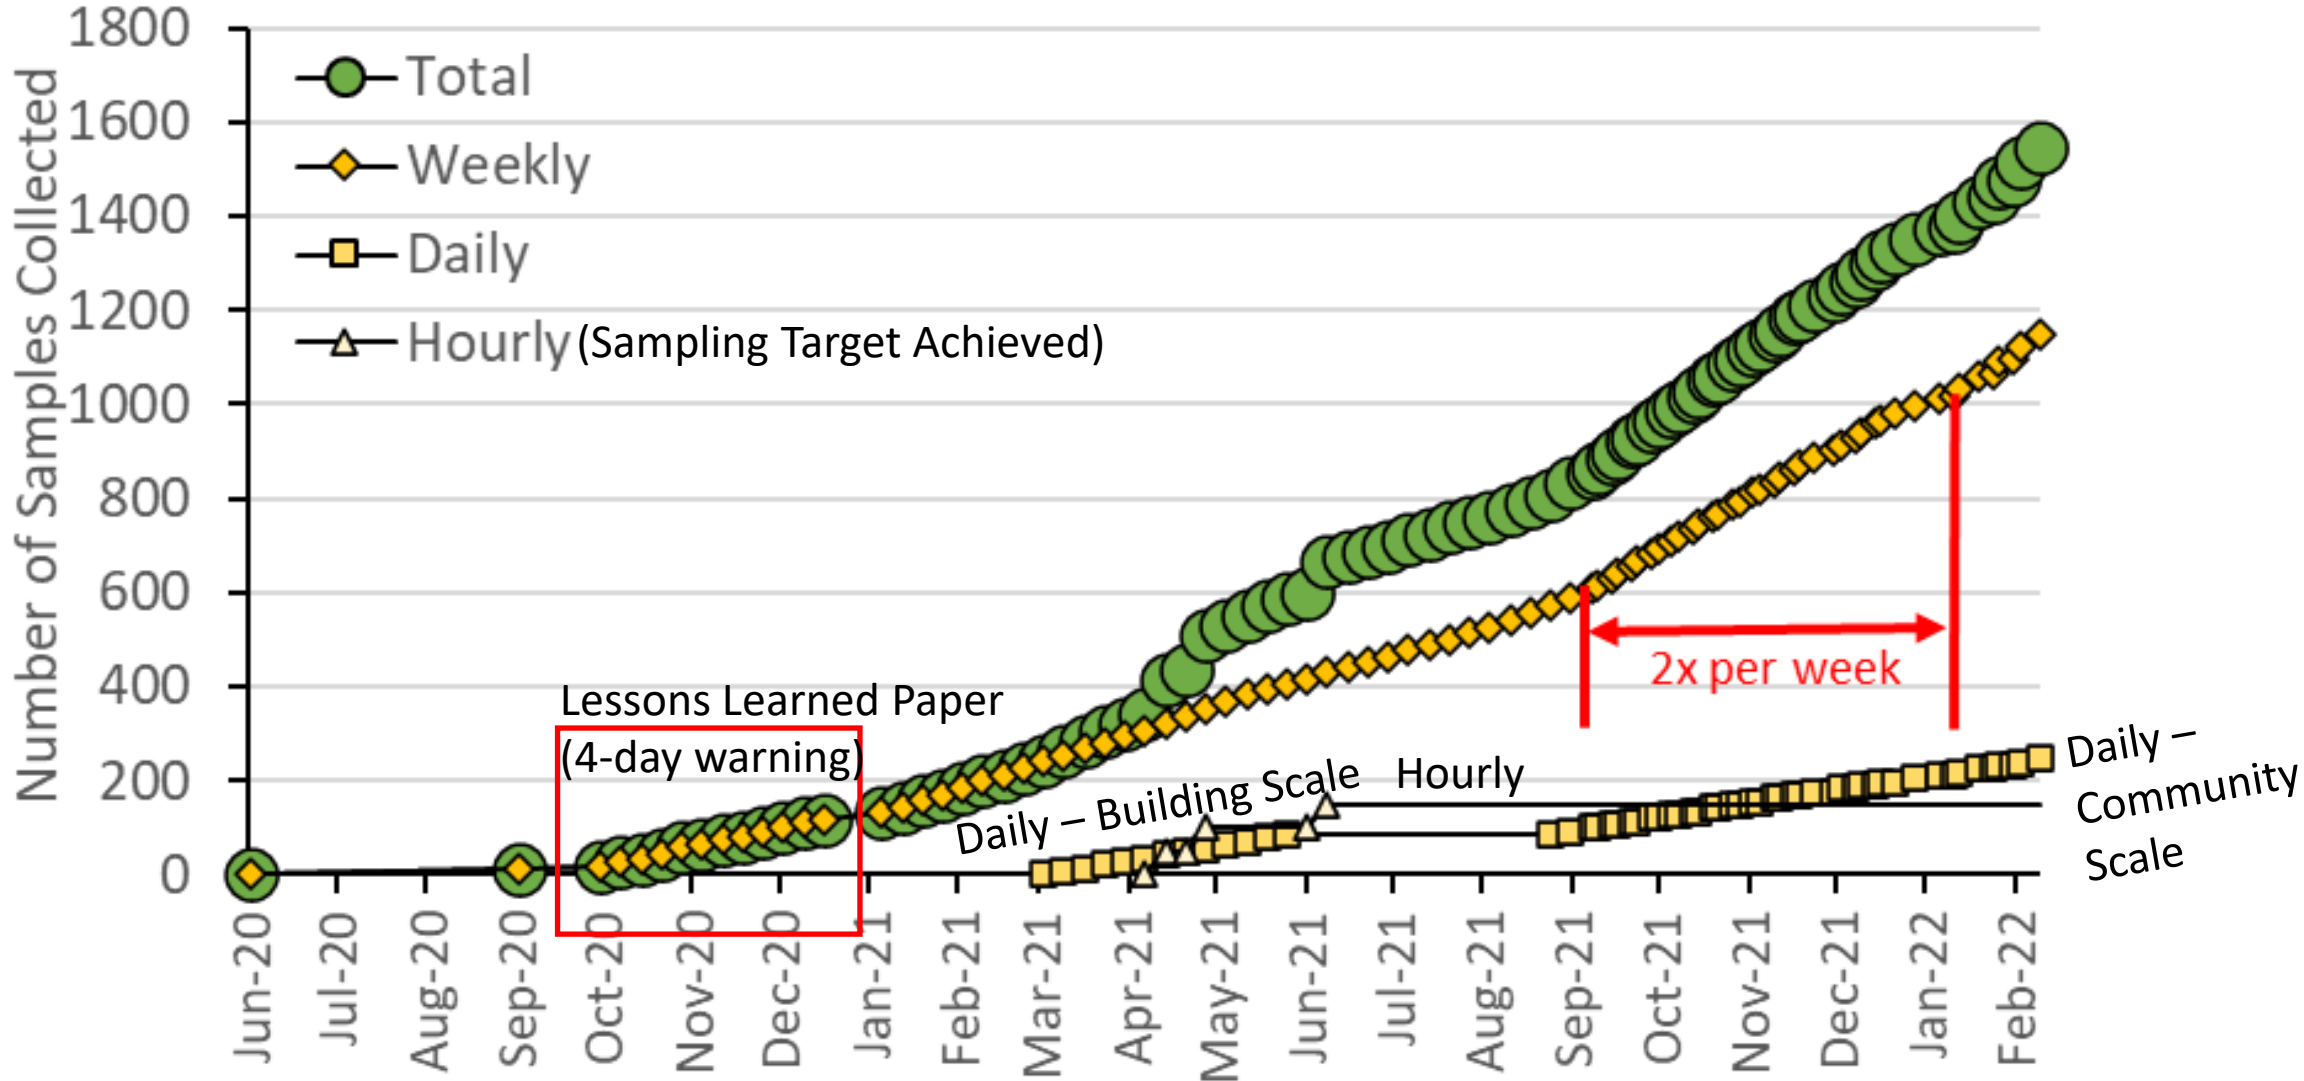

- Positives by zip code
- Number of tests by zip code

# Sample Collection Plans

Community Scale  
850,000

# Sample Collection

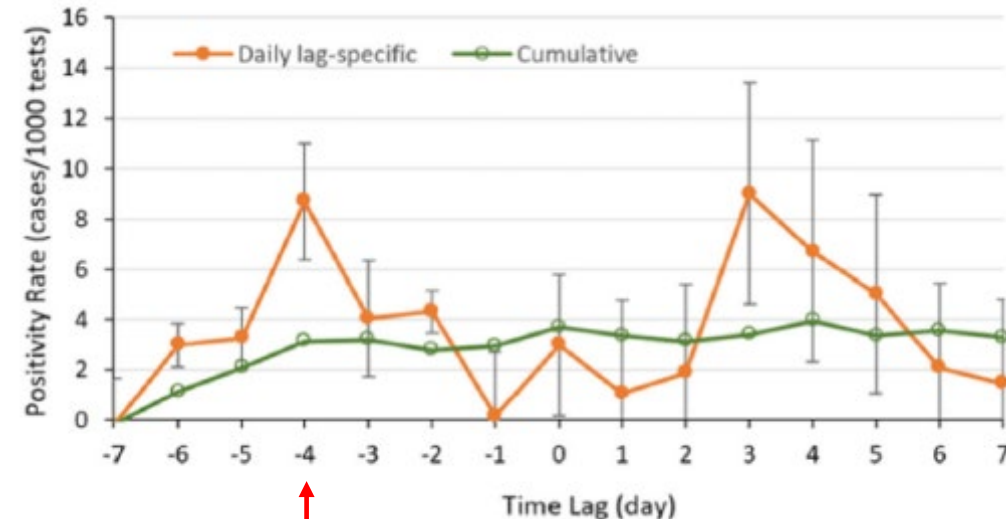

Lessons learned from SARS-CoV-2 measurements in wastewater

- A new innovative detection method (V2G-qPCR) was successful
- SARS-CoV-2 in wastewater was a 4-day lead indicator
- Positivity (%) =  $9 \ln(C) / 10$ 
  - $10^2$  gc/L of SARS-CoV-2 in wastewater associated with 4% positivity.
  - $10^4$  gc/L  $\rightarrow$  8%
  - $10^6$  gc/L  $\rightarrow$  12%

V2G – qPCR works and efficient

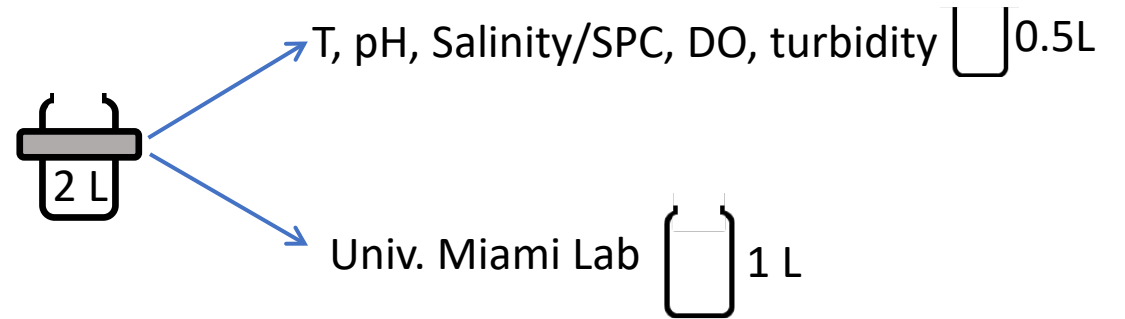

# SAMPLING at UMiami

Ambient:  
Date/time, GPS,  $T_{air}$ , Humidity

Collect Samples Weekly  
Results available in 12 hours

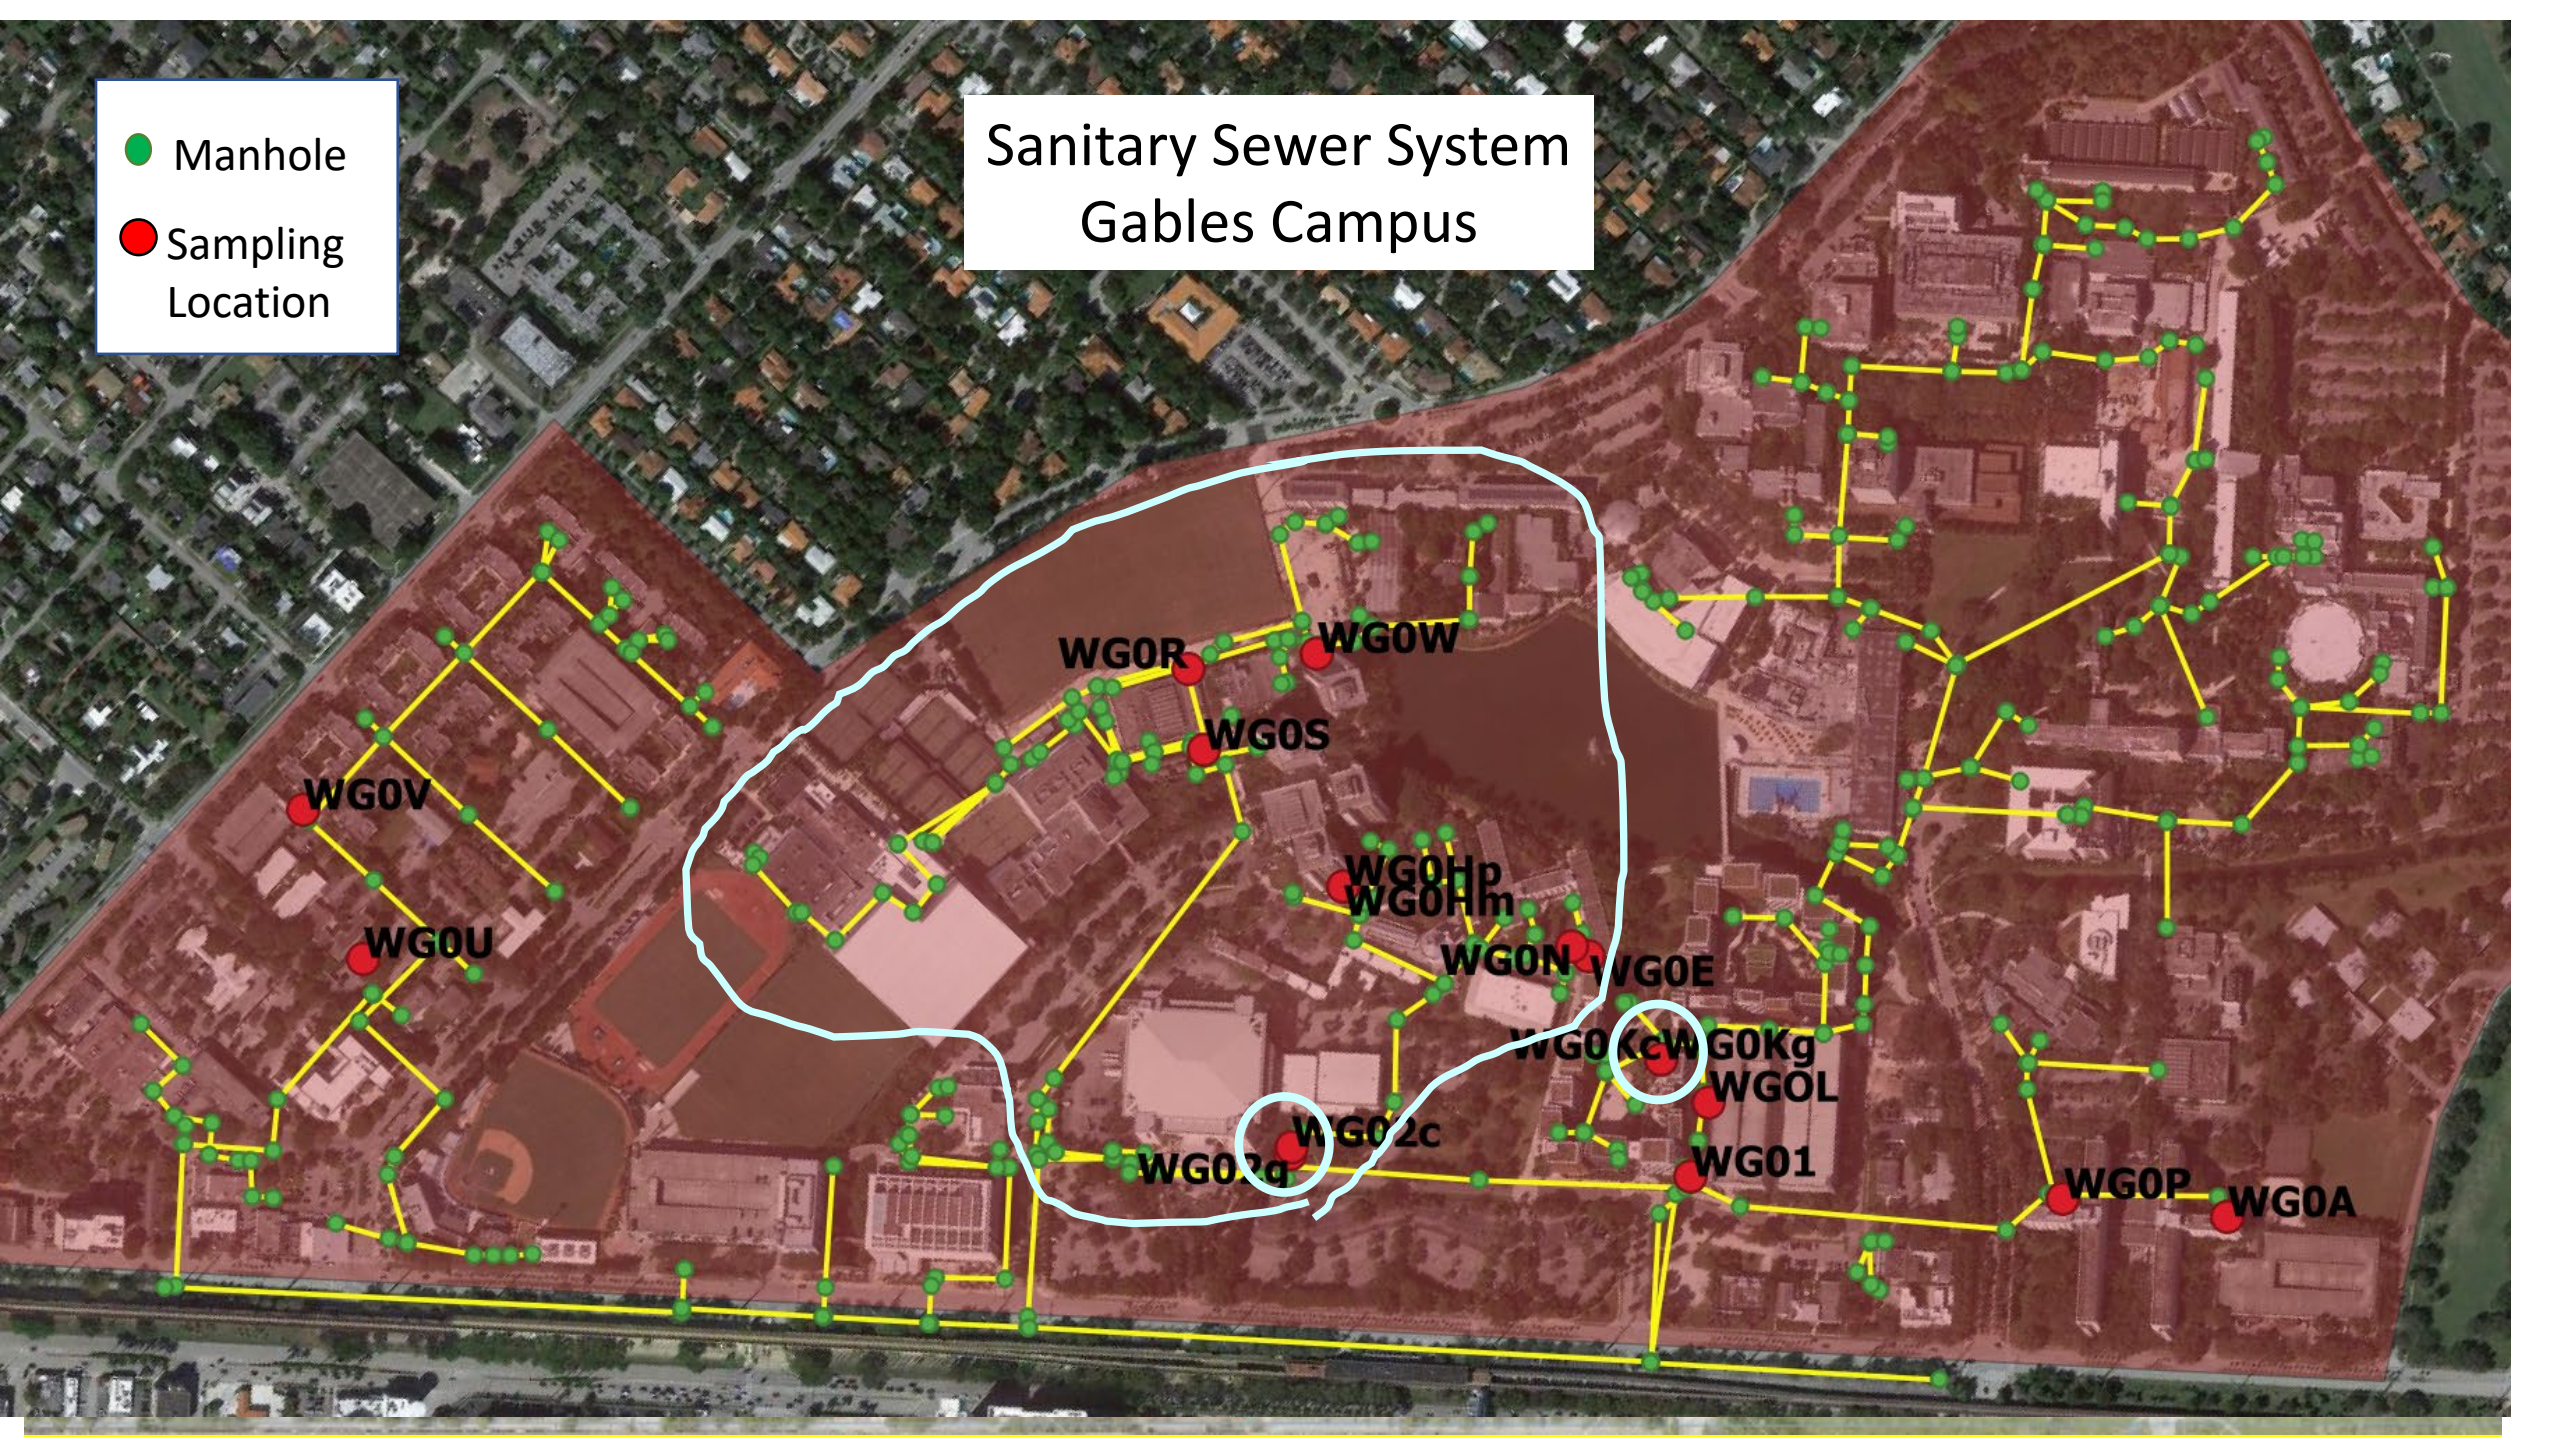

## Sampling Sites (Currently at 18 per day)

- 13 samples at Gables campus (undergraduate dorms)
- 1 at Marine campus
- 2 at University of Miami hospital
- 2 at the County Central District Wastewater Treatment Plant

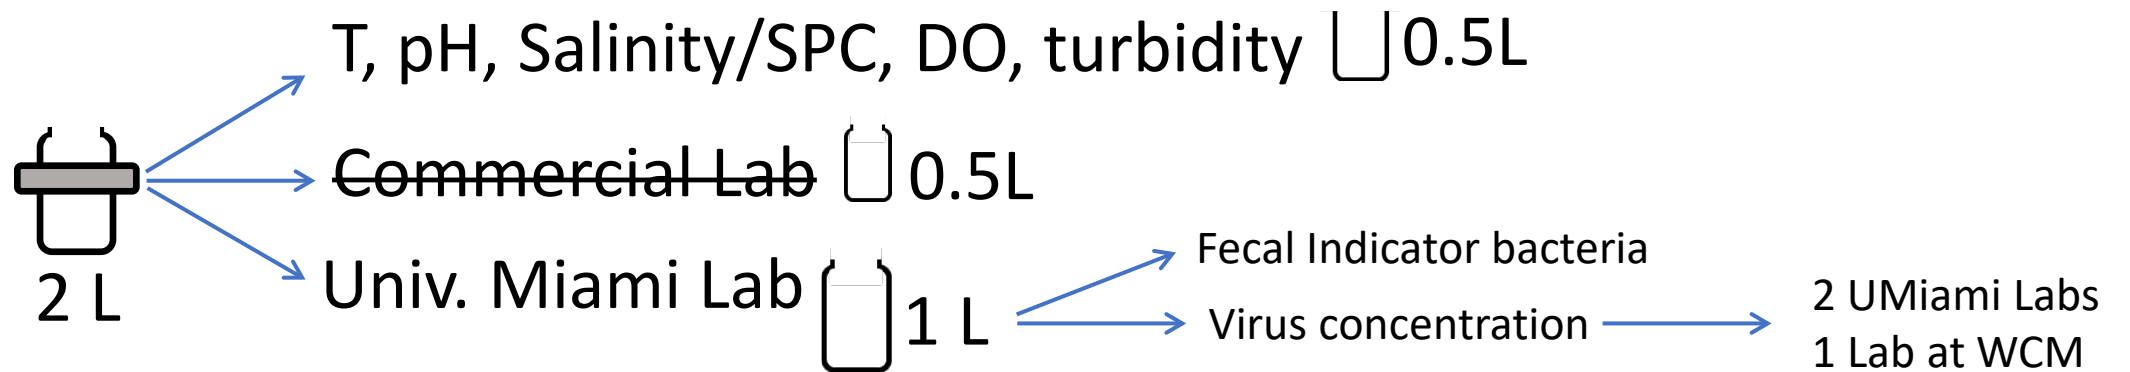

# Sanitary Sewer System Gables Campus

- Manhole
- Sampling Location

# Sampling

1. Add OC43 spike, recovery control
2. Add  $\text{MgCl}_2$  (50 mM)
3. Acidify to pH 3.5-4.5

pH meter

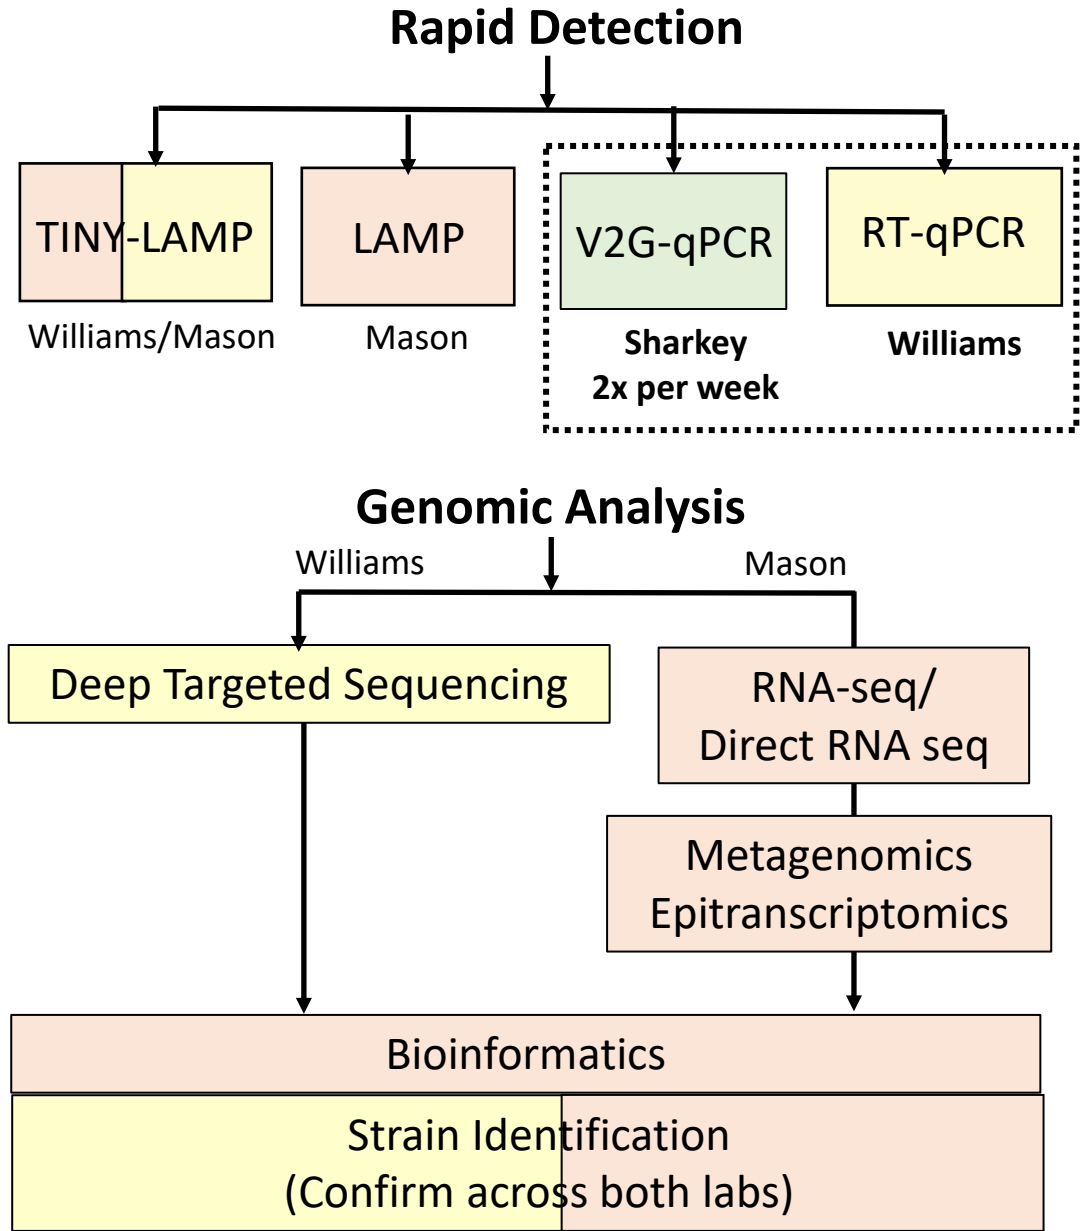

Continuous  
Stirring

# Sample Analysis Plan (Weekly Sampling)

- M. Sharkey,  
Center for AIDS Research, UM
- S. Williams  
Onco-Genomics Shared Resource, UM
- C. Mason,  
Integrated Genomics Lab, WCM/MetaSub

# SARS-CoV-2 Results

# University Surveillance

# University Surveillance

# University Surveillance

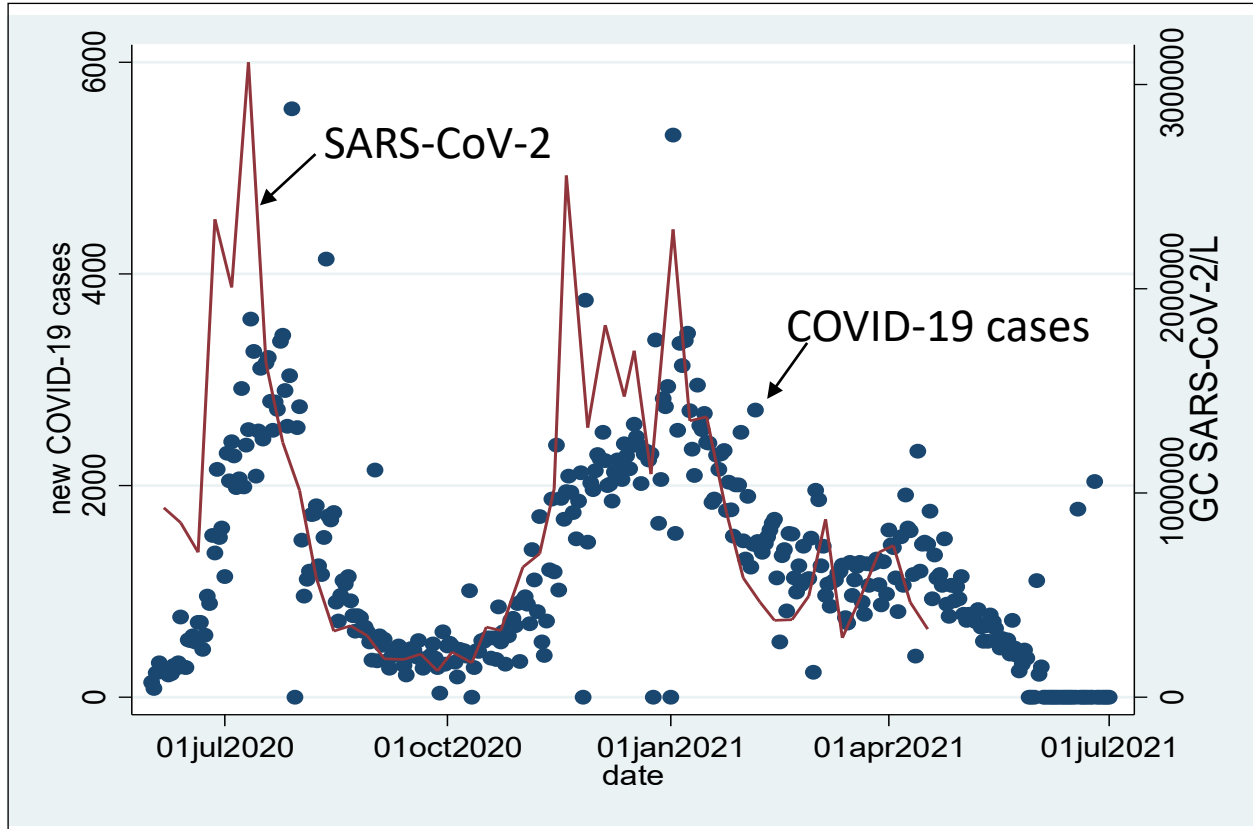

# County Scale (Miami-Dade County, FL)

Log-log association between SARS-Cov-2 and new COVID-19 cases shows that

a 1% increase in SARS-CoV-2 was associated with 0.69% increase in COVID-19 new cases, June 2020 to May 2021

**Coefficient = 0.69, 95% CI = 0.53 - 0.85; p < 0.01)**

Association between SARS-Cov-2 and new COVID-19 cases in Miami-Dade

Association between observed and predicted new COVID-19 cases in Miami-Dade

# Pilot study with Miami-Dade Public Schools

- UMiami also leading RADx-UP initiative (Dr Lisa Gwynn, PI)
- COVID-19 testing at 9 Miami-Dade public schools

Elementary Schools: Arch Creek,  
Greynolds, Fulford, Sabal Palm

Middle Schools: North Miami, JFK

High Schools: N. Miami, N. Miami Beach,  
Booker T. Washington

## Miller School to lead NIH COVID-19 initiative

The University of Miami Miller School of Medicine is one of just five institutions selected by the National Institutes of Health to develop a testing enterprise to safely return children to in-person school. The project will address coronavirus testing protocols, health education, and vaccine confidence.

“Maximizing Child Health and Learning Potential: How to Promote a School Culture of Safety in the Era of COVID-19.”

## Aim 2, Wastewater Characterization:

- *Evaluate Sample Concentration Methods*
- *Evaluate Sample Collection Methods (grab vs composite).*
- *Evaluate influence of watershed scale.*

## Sample Collection Methods

- **Grab** = Instant in time and space  
(fresh sample)
- **Composite** = Samples collected over  
time at one location (sample sits)

# Wastewater Sampling

➤ ***Where do we sample wastewater from?***

- Manholes (building scale)
- Pump Stations (cluster)
- Wastewater Treatment Plant

➤ ***How do we collect the wastewater?***

- Chain and bottle (grab)
- Automatic sampler (composite)
  - Samples on each hour, the entire day- 24 hours

# Watershed Scales

# Experimental Design

Experiments  
B, D, F

Split A: 100 mL for Concentration and Extraction  
 Split B: 10 mL for Fecal Coliform  
 Split C: 390 mL for Water Quality (T, pH, SPC, DO, Turb)  
 Split D: 100 mL for Composite

Experiments  
A, C, E

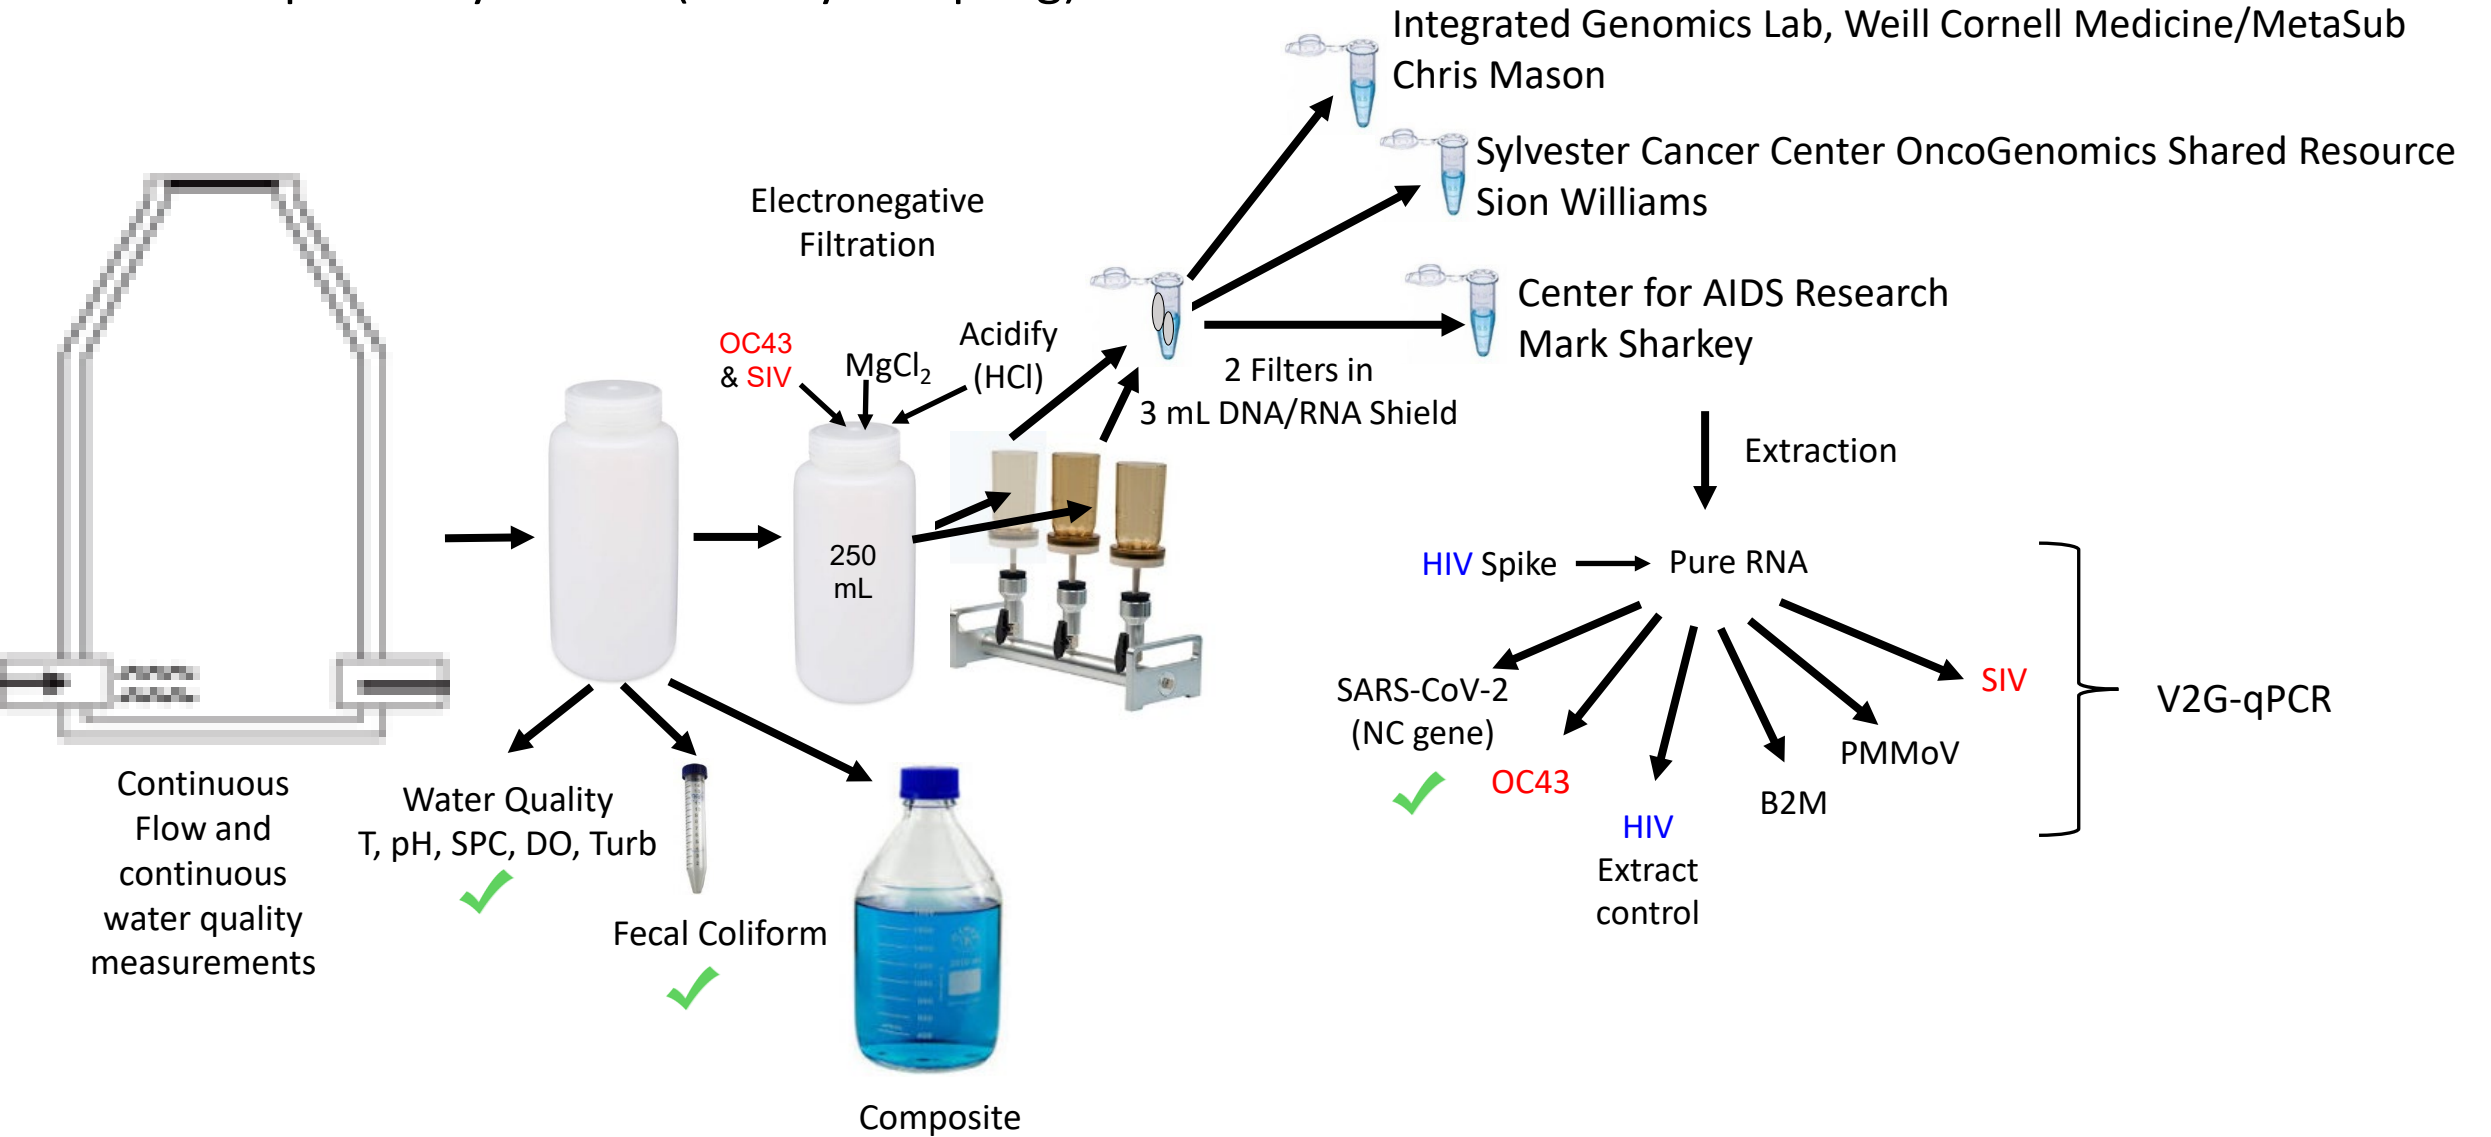

Split A: 100 mL for Concentration, Extraction, Analysis  
 Split B: 10 mL for Fecal Coliform  
 Split C: 390 mL for Water Quality  
 Split D: 100 mL for Composite

Compare degradation of SARS-CoV-2

Hour-to-hour variability

# Sample Analysis Plan (Hourly Sampling)

SARS-CoV-2

# Conclusions

- Wastewater in sewer variable.
  - 3 log-10 variation in SARS-CoV-2 observed at building scale
  - 1.5 log-10 variation in SARS-CoV-2 observed at cluster and community scale
- Degradation at room temperature, secondary
- Fecal coliform shows evidence of multiplication in sewer
- Specific conductivity correlated with fecal coliform at building scale

# Next Steps

- Complete analysis of remaining targets including metagenomics
- Run statistics

Aim 3:  
Integration with Human  
Health Surveillance

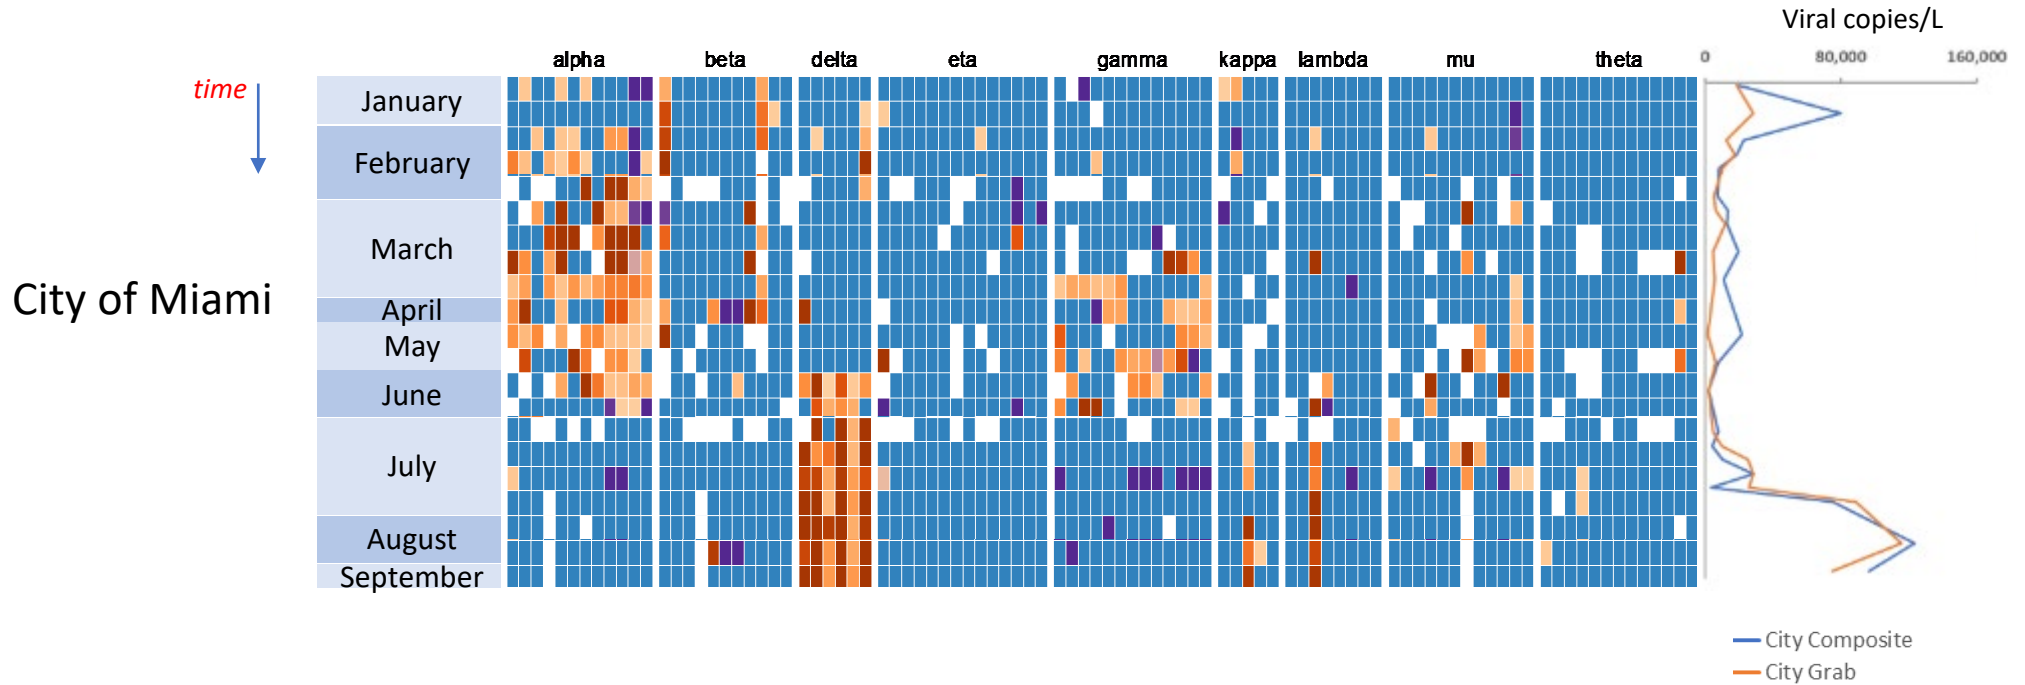

# Data and Methods Overview

- **Analysis pipeline** customized for metagenomic sampling
  - SARS-CoV-2 reads identified and filtered (**kraken2**)
  - Aligned to Wuhan reference with very sensitive local alignment (**bowtie2**)
  - Trim adapters (**ivar trim**) and deduplicate reads (**Picard**)
  - Compile coverage per base (**samtools mpileup**)
  - Variants called with liberal filters (min depth = 3; VAF > 0.1) (**ivar variants**)
  - Variants of Concern (VOC) per WHO-defined lineages examined
- Applicable to wastewater and clinical samples

# Performance of ARTIC protocol on clinical and wastewater samples: good library efficiency to amplify SARS-CoV-2

# Detection of SARS-CoV-2 Lineages in Wastewater

- SARS-CoV-2 lineages in City wastewater mirror patient data
- Even at low viral load lineages can be discerned
- High diversity followed by Alpha, Gamma, Mu, then Delta
- Delta detectable at -7 days before first sequenced case

# Detection of SARS-CoV-2 Lineages in Wastewater

- SARS-CoV-2 lineages in City wastewater mirror patient data
- Even at low viral load lineages can be discerned
- High diversity followed by Alpha, Gamma, Mu, then Delta
- Delta detectable at -7 days before first sequenced case

# Detection of SARS-CoV-2 Lineages in Wastewater

## March 16<sup>th</sup>

- Peaks on Gables Campus reflect the abundance of Alpha in the City and patients

# Detection of SARS-CoV-2 Lineages in Wastewater

## May 11<sup>th</sup>

- Low level Gamma cluster on campus
- Distinct from City lineage distribution

# Detection of SARS-CoV-2 Lineages in Wastewater

## July 20<sup>th</sup>

- Building 12, 072021, all students tested, all negative
- Lineage matches abundant Delta strain

# Detection of SARS-CoV-2 Lineages in Wastewater

## August 3<sup>rd</sup> – September 7<sup>th</sup>

- Delta predominant lineage on campus in alignment with City and patients

# Action Items

- Complete analysis of the changes in variant dominance in wastewater and patient populations
- Analyze daily data to decrease uncertainty in case predictions
- Evaluate normalization of SARS-CoV-2 using PMMoV, B2M, fecal coliform
- Analyze hourly data to evaluate representativeness of grab versus composite samples
- Evaluate magnetic bead concentration methods
- Continue data standardization
- Complete operational informatics infrastructure

# Acknowledgments: (NIH RADx-rad 1U01DA053941)
